Except for GSet, they are all XLU ops and ARE supported as tbr mentioned somewhere else in the mail. However, dickson told me that the GSet.4's are gone, and I made them illegal. Also note that EGFMul64 is not supported and illegal.

I just discovered that I failed to make the GMulAdd cases illegal, but they would not give correct answeres if you try them.
I will fix that soon.

Tim B. Robinson writes:

Do you know if mail to these aliases ends up in a news group (like for euterpe)? (I'm not a news reader, so I'm not sure how to check). I had asked for it to be set up that way, but a glance at the etc/aliases file leads me to suspect it may not be the case. If not, can you get it fixed please?

For mnemo checkins, I decided to reuse the muse.checkins.mnemosyne news group.

The pandora checkins are going into muse.checkins.misc (as are a lot of other things -- we haven't created any new groups for quite a while).

Actually, I wasn't referring to the checkins. If I understand it correctly, 'mail euterpe' results in something permanently logged in muse.euterpe or some such. That's what I'd like to be happening for the mnemo and pandora aliases. I'd asked ken to set it up that way, but I wasn't sure if it had happened.

Sorry, just ran across this message lying under a rock, metaphorically speaking. It looks as if mail to 'pandora' goes to the news group muse.pandora. However, mail to 'mnemo' doesn't appear to be saved anywhere.

Subject: CSM models

Design Folks,

New models have been checked-in for our chosen CMOS foundry, CSM.
The path to the HSPICE model library is:

```
.lib '/u/chip/technology/csm/hspice/models.lib' csm_60
```

The model library was constructed to make simulations using these CMOS models as transparent to the user as possible. The same flavors of MOS models (NS, PS, N, P, ...) and diode models (dwell, dsub, DW2SUBmodel) are available in the csm library as in the mobi library. The parameters, Nspeed and Pspeed, are still used to check MOS device corners.

Some information on the models:

MOS: CSM has provided HSPICE level 28 models for NMOS and PMOS transistors with minimum dimensions of W/L = 1.2/0.6 um. Level 28, a Meta Software modification of BSIM1, should be adequate for both digital and analog device modeling. MOS models are separated into 16 different device ranges, with boundaries at W = 1.2, 7.5, and 15 um and L = 0.6, 0.75, and 7.5 um. Expect some discontinuities at these boundary device sizes.

- * default channel length is 0.6um
- * default drain/source junction perimeters are:
ps='(w+1.6u)*(2-shrs)'
- * default drain/source junction areas are:
as='(w*1.6u)*(1-0.5*shrs)'
- * shrd/shrs parameters are still available provided default junction perimeters and areas are used.

Diodes: The library contains three diode models - DW2SUBmodel (NWell/Sub), dwell (P+/NWell), and dsub (N+/Sub).

- * default junction width for dwell and dsub is 1.6um.

Resistors: The following layer resistance models are included:

- * ndif - N+ diffusion
- * pdif - P+ diffusion
- * npoly - silicided N+ poly (2nd poly)
- * ppoly - silicided P+ poly (2nd poly)
- * plf - first layer routing poly
- * nw - N-Well
- * metall1 - first layer metal
- * metal2 - second layer metal

Capacitors: No model for the linear capacitor was provided. Models for the following parasitic capacitors are included in the library:

- * cmlact - M1 on active
- * cmlp1 - M1 to poly1
- * cmlf - M1 on field
- * cm2m1 - M2 to M1
- * cm2f - M2 on field
- * cplf - poly1 on field

Wires: Wire models for M1 (wiremetal1), M2 (wiremetal2), and poly1 (wireplf) are in the library.

- * default wire dimensions for metal layers is w=0.8um, l=10um
- * default wire dimensions for poly layer is w=0.6um, l=10um

Changes will be made to existing models as more information is provided by CSM. As always, comments/suggestions are welcome.

Subject: vref_942ph and vref_943ph

Geert,

As per the Csyn meeting, we've decided to remove the rule:

vref*_942p*h* vref_ab943phvwy reference

However, I cannot remove this rule from the csyn.signames file until bpw/stick's cells are fixed. Euterpe has both vref_942ph and vref_943ph.

Thanks,
Fred.

What do you mean by fixed? (change vref_942ph to vref_943ph?)

What cells need to be fixed? (all cache?)

Who is going to do this? (bp and myself?)

What about the other 4 bit group ops - are they supported?

I just sent a correction of the posting. The gset.4 class are not supported. However, all the XLU related ops are there in 4, 2, and 1 bit sizes. It is just the arithmetic related operations that we have pruned.

Except for GSet, they are all XLU ops and ARE supported as tbr mentioned somewhere else in the mail. However, dickson told me that the GSet.4's are gone, and I made them illegal. Also note that EGFMul64 is not supported and illegal.

I just discovered that I failed to make the GMulAdd cases illegal, but they would not give correct answers if you try them. I will fix that soon.

I believe the micro-arch doc is now fully up to date on these cases.

Subject: elib : found the problem .. me not crazy. just confused.

Hi Tim,

I was looking in :

/n/auspex/s41/euterpe-proteus/proteus

Apparently that is different from :

/n/auspex/s41/euterpe-snapshot/euterpe/proteus

I thought that Lisa had said that these two were linked together and were the same thing

When I do an ls in /n/auspex/s41/euterpe-proteus/proteus/verilog

I get :

BOM	Makefile	dclib	eclib	mlib	xlib	zclib
BOM.BAK	cerbmaster	diff.h	exlib	src	zblib	zeblib
CVS	clib	dxlib	libsrc	wrappers	zblibsrc	zxlib

NO elib or delib ...

Geert

Subject: Re: talking (the a2x faq)

This is a good opportunity for me to post the a2x and DragonDictate faq which I keep. You will find lots of information on hoarseness with DragonDictate.

If sending long messages like this annoys people on the list then please let me know. I do not intend to post the faq more than once per month unless there is a lot of interest.

Simon

The (unofficial) a2x faq is available as:

<http://www.cl.cam.ac.uk/users/sac/a2x-faq.html>

A preliminary version of the DragonDictate faq is also there:

<http://www.cl.cam.ac.uk/users/sac/dd-faq.html>

These are both maintained entirely by voice, so please forgive the poor format at present. Pearls of wisdom, hints, tips, dcoms and macros are all very welcome.

Simon

The a2x FAQ

Currently maintained by Simon Crosby entirely by voice, using DragonDictate and a2x.

This FAQ contains distilled pearls of wisdom about a2x, a piece of public domain software designed to interface the DragonDictate speech recognition system on a PC to a workstation running the X Window System.

A related FAQ, the DragonDictate FAQ contains information about DragonDictate and speech recognition systems for all types of computers, much of which is relevant to a2x, but not specific to it.

These FAQs are direct copies (shortened where possible) of postings to the a2x mailing list, the SOREHAND mailing list, and the C+HEALTH mailing list. Send contributions/corrections/updates/ideas to me.

Where to get a2x

The current version is on ftp.x.org as /contrib/a2x.tar.Z, or on the web here is the reference .

[Return To Contents List](#)

a2x Basics

(Mostly from the a2x man page)

a2x is designed to interface DragonDictate to the X Window System. a2x converts the ASCII output of DragonDictate into X device events. a2x is capable of manipulating both the keyboard and the pointer; depending on the applications, it is possible to use X hands-free through a2x.

a2x requires an X protocol extension to function. The XTEST, DEC-XTRAP, and XTestExtension1 extensions can be used. The XTEST extension was developed by the X Consortium for use in the X Test Suite, and an R5 patch to support the XTEST extension is available via anonymous ftp to export.lcs.mit.edu, as the file /pub/XTEST/R5fix-xtest-1. The DEC-XTRAP extension was developed by Digital Equipment Corp., and public versions are available for both R4 and R5. The XTEST extension has been incorporated as standard into the R6 server. The XTestExtension1 extension was originally developed for an old test suite done by an informal group known as the X Testing Consortium; the client-side library and some device-independent code exists in both the R4 and R5 core distributions, but only a couple sample servers (HP and X386) in the MIT distribution supports the extension (some product servers might though).

Note

From: Adrian Nye

From: steffen@iexist.att.com Date: Fri, 9 Sep 94 11:54:47 CDT

I tracked this down yesterday, it is now /pub/R5/fixes/fix-18.Z, but it is an optional patch and may not have been applied. Use xdpinfo to get the list of extensions.

The XTEST extension is compiled into the R6 X server by default if you build X from the X Consortium distribution (at least on my Sun). You probably already have it: use xdpinfo to check.

a2x was originally written for the XTEST extension, but both DEC-XTRAP and XTestExtension1 also work. The main difference as far as a2x is concerned is that XTEST permits time delays inside the X server, while with DEC-XTRAP and XTestExtension1 the delays are handled on the client side and hence can be somewhat less accurate, but time delays are rarely needed. In addition, XTestExtension1 does not provide a way to synthesize relative pointer motion, so the WarpPointer protocol request is used instead.

The Imakefile for a2x comes configured to use only XTEST, but you can configure it to compile in support for any or all of the extensions; a2x will automatically choose whichever extension is supported by the display. If you dynamically switch among different displays supporting different extensions, you will probably want to compile more than one extension into a2x. At the top of the Imakefile are #define's for BuildWithXTest, BuildWithXTrap, and BuildWithXTestExt1; simply set the ones you want to YES and the ones you don't want to NO. To see which extensions are supported by your X server, use xdpinfo. Your server must have at least one of "XTEST", "DEC-XTRAP", or "XTestExtension1" in order to use a2x.

The Imakefile also comes configured by default to assume that DragonDictate version 1.01 is being used, although the actual version can be overridden on the a2x command line. If you normally use DragonDictate 1.01a or 2.0 or higher, then change the #define for OldDragonDictate to NO before building.

The documentation provided here is for using DragonDictate and a2x solely for work under X; the assumption is that you do not use DragonDictate with programs on the PC. If you use DragonDictate with programs on the PC, you may need to create dcom files for switching between PC and X use.

[Return To Contents List](#)

a2x In Operation

There are two ways to run DragonDictate: directly under DOS, and under DESQview/X. See the man page for more details.

The normal mode of operation is to use a telnet program on the PC, and telnet across to your workstation and log in. For this you need an Ethernet card or similar on the PC, and a telnet program such as provided by PC-NFS or other products. You may wish to try using rsh instead of telnet, but the performance may be substantially worse. If you do not have a network connection, it should be possible to use a terminal program and log in to the workstation over a serial line, but performance over a serial line will likely not be as good as over a network. In the telnet session, run the script DragonDictate provided with the a2x distribution. You should be able to speak this, by saying "DragonDictate", "[enter\ key]", "OK" (the "OK" being necessary to pop down the menu to permit execution to continue). This script simply clears the screen and starts up a2x. Clearing the screen is a convenience so that the focus of attention on the PC screen will be the DragonDictate menus. You can, of course, write your own script or simply run a2x directly.

a2x takes each ASCII character produced by DragonDictate and determines a key on the X keyboard that can be pressed and released to generate that character. If Shift and Control modifiers are necessary to generate the character, a2x will automatically press and release keys for those modifiers. For example, for the character 'A', a2x will typically have to press a Shift modifier key, press an 'a' key, release the 'a' key, and then release the Shift modifier key.

It is not necessary to perform all of your "typing" through a2x; you can mix a2x output with direct keyboard typing and direct pointer manipulation. But, you should normally only switch between direct input and a2x input when all keys and buttons are in the released state, to avoid confusing a2x. (One simple exception to this rule is that you can use a2x to press/release buttons and keys while directly moving the pointer with your hand.)

How do I build a2x ?

From: Tom Knotts

```
>           I have one general question. After downloading the a2x
> software which compiler and which libraries do I need to
> compile the C-code. I am trying to run a2x over an
> X-Server. Who would know anything about interfacing the Dragon
> card to work with X. >
```

First, you do

```
imake -I/usr/local/lib/imake -DTOPDIR=/usr/a2x/X11R5
```

This builds a makefile with /usr/a2x/X11R5 the top directory (or wherever you choose to put it)

Then when you type "make" you get:

```
cc -o a2x a2x.o +O3 /usr/a2x/X11R5/lib/Xmu/libXmu.sl -lXtst
                        /usr/a2x/X11R5/extensions/lib/libXext.sl
                        /usr/a2x/X11R5/lib/X/libX11.sl
                        -L/usr/lib/X11R5 -L/usr/lib/X11R4
                        -lm
```

There are the libs you need. Notice /usr/lib/Xtstlib.a

From: Simon Crosby

Alternatively:

type "xmkmf" to make the Imakefile type "make" to make a2x -- easier this way !

You may also find it easier to say commands as words than the aliases
 you have defined, e.g. I removed all my single letter aliases for UNIX
 commands like find and make.

From: craig@mnemosyne.MicroUnity.com (Craig Hansen)

I'm a Kurzweil VOICE user, which supports multiple user-defined
 dictionaries, and I, too prefer using a single, large dictionary. In
 fact, I added vocabulary elements to permit spelling out single
 characters without changing mode. The problem is that without a
 mechanism to keep the mode in line with your current application,
 having multiple modes (dictionaries) is a source of errors, resulting
 from having the recognizer use the wrong dictionary.

From: dana@sybase.com (Dana Bergen)

I thought I was going to want to set up a lot of state vocabularies,
 but found it unnecessary. I'm finding that it works fine to have
 almost everything in the global vocabulary, and it saves the hassle of
 switching and keeping track of which one you're in. I have Unix, vi,
 mail, and window management commands all in my global vocabulary. I
 created a state vocabulary for using Frame, which suits the way I
 work; I switch around frequently between using Unix/vi/mail commands,
 but when I'm using Frame I'm usually using it for a while, so saying
 "use frame" when I start and "exit state" when I stop is not a big
 burden. It also lets me use commands like "page up" and "page down"
 and have them do the right thing whether I'm in Frame or vi.

From: Jack

I do almost exactly the same thing except that I immediately enter a
 state called "Unix" and stay there. There are certain Dragon
 functions that tend to kick you out of the state you are in and put
 you back in the global state (I forget their exact terminology). I
 just added dcom code to the commands that do that so that the last
 thing they do is to reenter the "Unix" state. I use emacs as an
 editor, so I can use the exact same macro for both emacs and frame.
 Since a number of editors have adopted emacs-like metaphors, I can
 (and do) use them all with the same macro for various basic emacs
 functionality... this works extremely well for me and I rarely have to
 think about voice recognition, I just use it, a case where ignorance
 truly is bliss...

How useful is DD / a2x for Programming ?

This is a summary from a request for support by Doug Evans, who needed help to persuade his company to spring for a DD setup. Shows that it works.

From: Doug Evans

This is way cool. Thanks for the replies. I took out the author's names. I think enough replies went to the list anyway.

I am an engineer and a DragonDictate user for 18 months. I do a lot of writing using Latex and Framemaker and some software (VHDL) development using emacs. DragonDictate works extremely well for the writing. Code development is not as easy but still works. I use DragonDictate for virtually all my computer input. I am a UNIX user and use a2x. I use DragonDictate 4-5 hours per day easily, which was about my level before I got RSI. My doctor does not expect I will ever be able to use a keyboard extensively again. DragonDictate costs \$1K for the classic version. That is peanuts. That is probably one day of work lost. Any management type who can't figure that out is an idiot. I could not work without DragonDictate, and I wrote some proposals this year which brought in almost \$2M of revenue. The choice is easy.

I am such a programmer, I am doing WWW development in C++ and other languages. I use DragonDictate and believe it has saved my career, your managers are full of it and I am proof. So there!

I use DragonDictate in combination with the freeware package a2x to program on a fulltime basis in the unix environment under X.

I never type.

I get about 20-40 words per minute input speed using DragonDictate. the range is so large because DragonDictate's comprehension really depends on whether it has heard you say a word before. I have been using it for six months, but will still occasionally run into stretches where I am using a lot of new jargon, and then I am frequently forced to correct DragonDictate's interpretation of what I'm saying.

My time is split into equal thirds devoted to C programming, Bourne shell and lisp programming.

I think it is an acceptable solution, and quite cheap considering what you get. In my case, it may have saved me from having to change careers due to my hand problems.

I'm a Senior Software Engineer at XXX. I investigate problems, write specifications documents, write code, and fix bugs. My work is in C in a Unix environment.

I use DragonDictate all day long. I can't type at all without pain, so I do everything with DragonDictate. I think that the effect on my programming productivity is minimal; i.e. I get pretty much the same amount of work done with DragonDictate as I used to get done typing. It's a little more of an impediment when writing a document; I create documents somewhat more slowly than before. However, I'm perfectly capable of doing what's needed for my job. I was a very fast typist; DragonDictate makes me more like a fairly slow typist. There are plenty of engineers here who are not super fast typists who do a good job. My company expects the same amount of work from me that they expect from other people, and this has not been a problem.

There was a pretty significant amount of time required to get going with DragonDictate in a Unix programming environment. Getting the various pieces of software and hardware working together correctly took some doing; getting macros and such set up took some doing; getting used to using DragonDictate took some doing. I spent a fair amount of time after hours working on my environment for the first month or so. During that period of time, I was doing my job using DragonDictate but wasn't as productive as I am now with it.

I use DragonDictate for all of my programming except assembler, which is a bit of a syntactical nightmare. Programming is easiest if you

1. Have a set of macros in DragonDictate which assist you in programming and 2. Have a customized editor with intelligence about what you are trying to do. I use emacs, and have written several (admittedly crude) emacs lisp functions which handle all of the syntax of C programming.

Let me give you an example:

I say "c-for-loop" and what I get in my emacs buffer, correctly indented to preserve the logical structure of the current program is:

```
  |  
  \ /  
  v for(;;) {  
  
}  

```

The arrow ending in 'v' above indicates where my cursor ends up, so that I can insert the first argument of the for loop. I have similar functions for all of the C structures and sub-structures. I also have words such as int, char, struct etc. which are commonly used. I can also comment out regions of code, where a region is a logical block, such as a function or whatever, and use blocks in movement commands such as "right-conditional" which steps right over the next conditional block.

If you are editing somebody else's code and they tend to use ghastly variable names such as lkjdsflkjdfsa, this could be a problem, but here again emacs comes to the rescue. In this case I say "lima kilo dabbrev-expand" and emacs tries to expand something which begins with the letters "lk", by looking back up the file. I'm no great lisp hacker, and I've promised myself that I will sit down one day and get this thing really sorted out (more intelligent), but it works well enough that I have managed to put that day off thus far.

As I've stated before on this list, I would be happy (in the spirit of a2x and emacs, which are publicly available) to provide my DragonDictate macros and emacs lisp code to anybody who wants it. I would hope that they could be improved by somebody with a bit more time and creativity, and again made public for general benefit.

Best of luck and I hope this will help persuade your boss that you will be better off with DragonDictate.

I use DragonDictate for practically all of my programming (c, c++, shell), documentation (latex), and email. I have been using it "full-time" since January 1991. Without it I would not be able to work and would need to find another profession.

Emphasize to your employer that carpal tunnel syndrome involves serious, permanent nerve damage. A complete dragon based environment can be assembled for under \$4000, perhaps under \$3000. Your employer will find this to be a lot cheaper than the costs of worker's compensation and long term disability which they will incur if they push you to keep working in a way that you know will injure you.

Lastly, I would encourage the individual to purchase their own system, if they are able. I own my recognition system and am happy with the decision to buy it myself. I'm too dependant on it... it would be like someone else owning my fingers.

I do R&D [...] at XXX. I just wrote a 700 line C language program on UNIX in a few weeks, and I'm continually changing a large HyperCard application on a Macintosh. In a few months I expect to be programming on a PC in Visual Basic and ToolBook. I use DragonDictate all day with up to 3500 utterances/day with less than 3% errors. I can dictate as fast as I could type, although it took 6 months and writing 700 voice commands to become that proficient. Here is the standard blurb I post to our internal netnews:

I've been unable to type or use a pointing device for more than a few minutes since my Repetitive Strain Injuries became severe in March 1993. Permanent continuous pain and partial loss of the use of my hands was becoming likely due to permanent nerve damage if I continued typing, so I stopped. Since then I have assembled a voice-controlled computing environment on a PC, UNIX workstation, and Macintosh.

I've evaluated and assembled many pieces of software and hardware and written hundreds of voice commands to integrate them. I'm using the DragonDictate Classic speech recognition product running on a PC connected to the a2x program controlling the X Window System running on a Sun workstation. This allows me to enter and edit text and UNIX commands and control the (mouse) pointer by voice. I also control a Macintosh by displaying its screen on the Sun workstation using InterCon's Planet X software. You can use a simpler version of this system if you just use a PC, or if you use a mainframe but can login from a PC. The cost of the basic system (DragonDictate Starter at \$695 plus a 486/33MHz PC with 8M memory) is about \$2700. It takes a few weeks to get comfortable using it; after 6 months I could dictate as fast as I could compose text and as fast as I used to be able to type, about 15 words/minute.

My main uses of this voice-controlled computing environment have been word processing, email, C and HyperCard programming, and gathering information from our library, Usenet, and CD-ROM and Internet databases. I can do everything by voice that I used to do with a mouse and keyboard.

Due to a chronic RSI, I have been using DragonDictate for over 3 years to do software development in C/C++ on the following platforms: DECwindows/Motif on VMS, Motif on Unix (a little), and DOS/MS Windows. I feel that DragonDictate allows me to be approximately as productive as I was when I was typing. By this I mean that although some tasks take a little longer, other tests are actually easier using DragonDictate, and in the long run it more or less evens out.

I am extremely satisfied with DragonDictate. Without this product, I doubt whether I would be able to continue in my career as a software engineer.

Return To Contents List

Troubleshooting with DD / a2x

People frequently have problems with the undo facility of a2x. Here is a sample of postings.

From: Bob Scheifler

how do you represent a
key such as Escape or Tab as a key in the ?

You can actually put control characters directly in the file, but it's probably easier to use ^ followed by a character. The usual convention is followed of using the character you get by adding 0x100 to the control character. E.g.,

^@ NUL ^I TAB ^J LF ^M CR ^[ESC

And one special case:

^? Delete

Date: Thu, 30 Dec 93 17:59:58 CST From: steffen@iexist.att.com

How can I use the a2x undo facility for the [back 1] macro? I have it defined as

```
add-word /t "[back 1]" "{Del}" invisible
```

for a2x. I tried changing it to

```
add-word /t "[back 1]" "{Ctrl+t}{Ctrl+c}?" invisible
```

but it inserts '?' instead of deleting the previous character when I use it.

P.S. I'm working on a complete .a2x undo file for emacs macros and am using the DragonDictate 2.0 macro state facility to keep the a2x undoable emacs macros local and the regular emacs voice macros global because I occasionally use emacs outside a2x or in DOS.

Date: Fri, 31 Dec 1993 12:16:14 EST From: Bob Scheifler

I tried changing it to
add-word /t "[back 1]" "{Ctrl+t}{Ctrl+c}?" invisible
but it inserts '?' instead of deleting the previous character when I use it.

Right, because {Ctrl+t}{Ctrl+c} means "turn on the X Control modifier", it doesn't mean "make an ASCII control character". So, if you have a key on your X keyboard with '/' in the unshifted position and '?' in the shifted position, what a2x generates is an event for that key that has the X Shift and Control modifiers turned on.

The reason you can't just use {Del} for your purpose is that DragonDictate won't generate a backspace for it, so a2x won't see it to undo it. So what you need to do is specify, by keysym, the key you want to press. Assuming that key is labeled Delete, you can use

```
{Ctrl+t>Delete{Ctrl+t}
```

That's a bit long, so you can also do it by hexadecimal keysym value:

{Ctrl+t}ffff{Ctrl+t}

That's still a bit long, but I can't think of a shorter way to do it without adding something to a2x.

To make sure the key is labeled Delete on your keyboard, use xev to see what key is pressed when you send {Del} through a2x.

Now, to undo that (using the emacs undo command), you can put

^TDelete^T: ^_ ^Tffff^T: ^_

in your .a2x file.

Subject: help with undo? From: D!

in response to my previous questions, a number of people explained .a2x files to me as a way to do undos. However I can't get them to work at all! Can someone help me? Here is an example:

I have macro [click 1] assigned to
{Ctrl+t}{Ctrl+b}1{Ctrl+t}{Ctrl+t}{Ctrl+b}1{Ctrl+t}

in my .a2x file I have the following line: ^T^B1^T^T^B1^T:

I thought that would make the "undo" for [click 1] a no-op. But when I say "scratch that" after a [click 1], I get 6 backspaces instead.

What am I doing wrong?

I am using DragonDictate V3.0. Maybe my version of a2x doesn't work with DragonDictate V3.0? I think I have a2x version 1.12.

From: steffen@iexist.att.com Subject: Re: help with undo?

As you discovered, telnet usually swaps backspace and delete by default. For PC-NFS use the -y option, for other software check the manual.

Also you need the latest a2x that was updated at the end of last year. The first line of a2x.c should be

```
/* $XConsortium: a2x.c,v 1.129 93/12/29 20:15:28 rws Exp $ */
```

From: dana@sybase.com (Dana Bergen) Subject: Re: DESQview/X 2

>Has anyone had success using any version of DragonDictate with the newest >version of DESQview/X? Hints would be appreciated. Thanks.

I'm using DragonDictate 3.0 with DESQview/X version 2. This is the only configuration I've used, so I can't tell you what is different from previous versions. I'm using the PC network software that comes with DESQview/X 2. I haven't had any of the hanging/crashing type problems that people have apparently had with some combinations. I have encountered the following two problems with the interaction of the two packages:

-- I had to get rid of the dragon logo that is displayed at startup of DragonDictate 3.0 because it hung my remote DESQview/X window. (Delete the file dd.bit.)

-- Old menus hang around on the DESQview/X window on my workstation. This is really annoying because sometimes it's not obvious whether what's up there is "real" or not. I've corresponded with both Dragon and Quarterdeck but no one seems to have solved this.

From: doug_bernard@tmai.com (Doug Bernard) Subject: Re: demise of DD

hotkey in telnet session

This is a dcom entry that preserves the DragonDictate hotkey in the telnet session (thanks to Jack for the tip on the kbh (keyboard handler) command):

```
; "[start UNIX]": ; .. telnet to cougar; pause; login as dougb; pause
; .. start a2x ; .. remove DD choice list via dkey {Enter} ;
.. call-to-state a2x (do last because takes some time to switch)
add-word /t /g "[start UNIX]" "telnet cougar{Enter}{Dcom}pause
4000{Dcom}{Alt+c}kbh off{Enter}user{Enter}{Dcom}pause
200{Dcom}password{Enter}{Dcom}pause
6000{Dcom}DragonDictate{Enter}{Dcom}dkey
{Enter}{Dcom}{Dcom}call-to-state \"a2x\"{Dcom}" i
```

I also use the following to quit:

```
; "[quit UNIX]": this will work whether or not a2x is running: ;
.. exit a2x via ^t^e; hit enter key (in case a2x not running); pause
for a2x to exit ; .. logout of remote host; pause; exit telnet; pause
; .. remove DD choice list via dkey {Enter} ; .. return to state
preceeding a2x (do last because takes some time to switch) add-word /t
"[quit UNIX]" "{Ctrl+t}{Ctrl+e}{Enter}{Dcom}pause
1000{Dcom}logout{Enter}{Dcom}pause 3000{Dcom}{Alt+x}{Dcom}dkey
{Enter}{Dcom}{Dcom}return{Dcom}" invisible
```

Here is another problem -- the automatic capitalization of words by DragonDictate at the end of a sentence can cause problems with the control sequences embedded in your DragonDictate/a2x macros:

From: steffen@iexist.att.com Subject: Re: problem with ^T vs ^t

From: carroll@zko.dec.com
my a2x session keeps getting screwed up, and I finally figured out why. Apparently, a2x does not consider CTRL+T the same as CTRL+t! therefore, when I do something which causes the next character to be capitalized (such as "period", [capitalize word], [begin uppercase], [shift-key], etc), and then say a macro of the form CTRL+tCTRL+t, (such as [click 1]), it gets screwed up because it doesn't pick up the first ^T.

The only fix I have found for this is to change my macros to things like
"{dcom}lowercase-word{dcom}{Ctrl+t}{normal-case>Delete{Ctrl+t}}.
(The {normal-case} is necessary because "Delete" *must* be capitalized for the XServer to recognize it.)

Get rid of the sentence-ending punctuation capitalization -- it is an endless source of errors. Here are DragonDictate 3.0 commands to do it and define begin sentence and paragraph beginning macros, so you get capitalization only when you want it:

```
; don't capitalize after sentence-ending punctuation characters ;
note: these lines cause an error in DragonDictate 2.0 punctuate
"." \"period\" left punctuate "? \"question mark\" left punctuate "!"
\"exclamation point\" left

; use these macros instead add-word /g /t "[begin paragraph]" "" c l r
add-word /g /t "[begin sentence]" " " c l r
```

From: dana@sybase.com (Dana Bergen) Subject: Re: problem with ^T vs ^t

>; don't capitalize after sentence-ending punctuation characters >;
note: these lines cause an error in DragonDictate 2.0 >punctuate

```
". \"period\" left >punctuate "? \"question mark\" left >punctuate
"! \"exclamation point\" left
```

I like having these available, so I have a second set of macros that don't punctuate -- "dot", "hook mark", and "bang" (actually "dot" is already built in) -- which I use when I'm not about to dictate another sentence. Between these and having added the lowercase-word dcom to my escape key macro (for using with vi), I've generally eliminated the problem. I think which approach is best depends on what kinds of things you do.

Window Manager Hints

From: steffen@iexist.att.com Subject: .twmrc for [doit] and others

It took me considerable effort to duplicate the .twmrc lines for a2x window management voice macros:

```
"F3" = c|m|s : w|t|i|f : f.delete Button1 = c|m|s : w|t|i|f|r : f.menu
"defops" Button1 = m : w|t|i|f : f.raise Button2 = m : w|t|i|f :
f.lower Button2 = c|m : w|t|i|f : f.iconify Button3 = m : w|t|i|f :
f.move
```

but I'm unsure what Execute and KP_F1 to 3 are supposed to do and how to define them. It would be good to put all these in an add2.twmrc file in the a2x distribution.

From: Bob Scheifler

It took me considerable effort to duplicate the .twmrc lines for a2x window management voice macros:

They were really only intended as examples of writing macros, not as something that I expected everyone to use.

but I'm unsure what Execute and KP_F1 to 3 are supposed to do and how to define them.

In my personal environment, I have customized various programs so that saying "[doit]" does something similar in most windows. At the time I wrote the documentation, I had "[doit]" press the key labeled Execute. Since then I've changed it to press the function key labeled F8. In my X resources, I have for example:

```
Xmh*tocMenu.Accelerators: #override\n\
...
!;F8: XmhCommitChanges()\n\
...
```

so that "[doit]" in the main xmh window commits my folder changes. In my .emacs I have

```
(global-set-key "\e[19~" 'save-buffer)
```

so that "[doit]" in emacs saves my buffer. (ESC[19~ is what emacs generates when I type the F8 key.) Similarly, in my .rk.keys file I have

```
accept_to_end_of_line "^[[19~" # F8
```

so that "[doit]" at a shell running the Reactive Keyboard will accept the prediction and execute the command line.

That should give you the flavor, choosing one function key for a given voice macro and then customizing multiple programs to react to that key in a similar manner.

As for the KP_F* keys, my .twmrc has something like:

```
"KP_F1" = : all : f.warpto "Emacs" "KP_F2" = : all : f.warpto "Xmh"
"KP_F3" = : all : f.warpto "XTerm"
```

From: dana@sybase.com (Dana Bergen)

Here is a way to get those coordinates for pointer jumps. I use olwm and I have the following in my .Xdefaults:

```
olwm.ShowMoveGeometry: True
```

This means that when you grab a window or icon and move it, the coordinates are displayed. If I want to know the coordinates of a location I drag an icon over to it. If you want the location relative to a window, just subtract from the corner coordinates (or move the window to 0,0 before you start).

Contributed Voice Macro Sets

Several people have contributed their voice macro sets for general consumption. Here are my (Simon Crosby) DragonDictate macros, emacs lisp code for programming, and my vtwm key bindings. Please note that I'm no great lisp hacker and if you have any improvements, I'd be most grateful.

Dana Bergen's voice macros are here. Dana had this to say about her macros: "Here are my global macros, followed by my Frame macros, with some explanatory remarks interspersed. I agree with Jack that you'll want to mostly create your own macros on the fly to suit the way you work. However, these will give you some ideas."

From: dana@sybase.com (Dana Bergen) Subject: vi tip

I experimented with using a special state for vi command mode, but decided that for the way I work it wasn't worth the trouble. The types of errors it prevents don't happen to me that often. However, I found it useful to make the following changes to the [escape key] macro:

```
-- Change the punctuation to "left right" instead of "invisible" --
Add the "lowercase-word" Dcom as part of [escape key], i.e., in the
Edit window it should look like this:
```

```
{Esc}{Dcom}lowercase-word{Dcom}
```

This avoids the situation where the last thing you typed in input mode was a question mark or period, and your next command gets messed up by the spacing and capitalization.

Here are Jack's macros(jack@eit.com). Jack had this to say about his macros: "On the subject of creating macros and deciding which to create, I'd recommend simply creating what you need as you need it. The set I posted were the third or fourth set I'd developed and I

believe that each new set was smaller than the one before it. While this means that you can't sit down and enter everything you need in one session, it will create only what you do need; after the first set you can save them to ASCII and load them into a new version of Dragon or whatever. I found that looking at the first ASCII dump that there were many, many macros that I had completely forgotten about, mainly because I never used them more than a couple of times at maximum. Another point is that it takes some time to develop your "style" which will also affect what macros you create. There are also linguistic choices to make on the basis of phonetics; you want phrases that are as discernible as possible. For example, I had the hardest time using the phrase "enter key" because it sounded like so many other things. I found that using the phrase "carriage return" was much more easily discernible from other parts of my vocabulary." Here are some macro files for lisp, latex, and emacs, contributed by Wati (taylorw@marie.mit.edu (Washington Taylor)). Here are his emacs lisp macros for cursor control. Says Wati: "Files are separated by =====". There are some macros in the latex and emacs files which are specific to my own purposes -- I commented some of these out but left them there as examples. Hope this is useful. (I don't program much in lisp, so that file is fairly short -- the latex file, however, is probably almost everything you need unless you are an extremely serious user)" Return To Contents List

Useful DCOMS / Macros

From: taylorw@marie.mit.edu Subject: "enter key"

> From Jack jack@eit.com > > For example, I had the hardest time using the phrase "enter > key" because it sounded like so many other things. I found that using > the phrase "carriage return" was much more easily discernible from other > parts of my vocabulary. >

Since I want to hit the enter key frequently, I use the single-syllable word [ret] for the enter key. I don't have any problem with dragon confusing this with "bet", "net", "debt", "get" or anything else. And it certainly speeds things up. In general, I use shorter utterances for frequently used words, as in natural language or Huffman coding.

From: Simon Crosby

> From: Rob Hutten Subject: The dangers of voice recognition oh man.
> This just happened: Phone: Ring, ring. Me: [to DragonDictate] Go to
> sleep. Phone: Ring, ring. Me: [answering phone] Voice console?
> aargh.

Easy to overcome this. Train DD to recognise the phone and turn itself off automatically. I have a macro which produces no output, which is [phone ringing]. 1. Get someone to call your office when DD is "live". 2. DD will spit out some garbage after the first ring. 3. Pick up phone after first ring to stop it 4. Correct DD by saying "begin spell mode" and then enter the new macro such as my one above, with no key strokes.

5. Repeat until DD is trained.

6. The macro should be as follows:

```
add-word /g /t "[phone ringing]" "{Dcom}console{Dcom}g"
```

Voila !

This will turn off the mike whenever the phone rings.

From: Scott@ccgate.dragonsys.com

>I am hoping to be able to run programs which are incompatible with
>DragonDictate without too much pain. I am hoping to do this by, in
>an automated fashion, > > 1. unloading DragonDictate > 2. running the
incompatible application > 3. loading DragonDictate

>can anyone help me?

There is a program in the DICTATE3 directory called UNDD.EXE. Run
this to unload DragonDictate. If you have changed your voice files,
you will be prompted to save them.

If you do not want to be prompted to save your voice files, start up
DragonDictate with the /v command line switch, e.g.,

dd /v [other options]

This will allow DragonDictate to unload without stopping for anything.
Be careful with this switch though, you may lose new training, words
and macros if you haven't saved your voice files.

Return To Contents List

Useful Shell Scripts

From: Simon Crosby Simon.Crosby@cl.cam.ac.uk

Here's a useful bash macro which saves the "/" in dictating file names
and paths on unix:

In other words

cd foo/bar/baz "cd foo slash bar slash baz" becomes

cd foo bar baz

```
cd () {  
    builtin cd $*  
    shift  
    for i in $*  
    do  
        builtin cd $i  
    done # the following is useful if you frequently ls when you  
get there..  
    ls }  
}
```

From: daft@debussy.crd.ge.com (Chris Daft) Mike Burrows was kind
enough to send this solution for the C-shell.

There's probably a more efficient way, but this csh alias for
cd does something similar to Simon's shell function:

```
alias cd chdir `echo \!*\ | sed \s, ,/,g\`` ; pwd
```

This makes:

```
cd foo bar  
turn into  
chdir `echo foo bar | sed 's, ,/,g'` ; pwd  
which then turns into  
chdir foo/bar ; pwd
```

Mike Burrows

PC Telnet Software

Most people seem to use PC-NFS 5.0, which includes a telnet program suitable for use with DragonDictate. Nobody has reported problems using this software, which also lets you mount nfs files over the net (so for instance your voice files could live on Unix or whatever). People have experienced problems with some other telnet software:

From: etonumo@hisoy.etn.ericsson.se (Ulltveit-Moe Nils) To: a2x-users@x.org Subject: query: telnet trouble.

I am a new DragonDictate user, and have problems with getting Telnet to work properly with PCTCP.

The tn program seems to read the keyboard hardware itself, so it does not work with DragonDictate. There is also another Telnet program supplied (tnglass) which works with DragonDictate, but does not do the right terminal emulation, so for instance the arrow keys does not work.

From: sproul@sybase.com (Nelson Sproul)

PC/TCP works with DragonDictate if the latter is executed with the /k9 switch.

From: RDruker@RohmHaas.com (Mr. Ross Druker)

We have successfully compiled a2x for AIX 3.2.4 (has XTEST Extension 1), and *can* do the following operations via DragonDictate:

- o change mouse position
- o change window focus

So we know things are close to working. However, we can't "type", that is, when we speak or type keyboard input from the PC, it does *not* get echoed on the UNIX machine.

Using -e (for debug), ls yields "ls ^M" on the PC.

Can anyone help? Is there a command to turn on keyboard input, or is there another problem?

BTW, we are using FTP Software's TN program on the PC (version 2.3).

From: dp@world.std.com (Jeff DelPapa)

The problem is in TN. You will discove when you exit it, all the stuff you dictated will appear at your dos prompt. TN looks directly to the keyboard hardware, and ignores the DOS keyboard buffer. FTP software was completely unwilling to do anything when I reported it a year ago, but may have moderated. (the telnet that comes with DV/X doesn't have the problem, so I didn't push things).

From: rbd@sst.ll.mit.edu (Robert B Dunn)

> I am running DragonDictate on a PC connected on an ethernet and
> trying to get the PC output to my Sparc 2 workstation. I can
> accomplish this using the Desqview X software, but.....

I had the same problem with my version of telnet. I think some versions of telnet lock out DD. I use Kermit (IBM-PC Kermit-MS: 2.32/A 21 Jan 1989) to connect to the sun through the serial port. This works fine for me, and the DD popup windows come up on my PC screen which I have next to my sun workstation monitor (which I find satisfactory). I suggest you get kermit or find out what version of telnet other a2x users have.

When you run ac2 through your telnet you should be able to type on the PC keyboard and have the output come up on the sun. Typing {c-t}{c-e} on the PC in the telnet window should gracefully exit a2x.

Return To Contents List

The a2x Olympics

Finally, a bit of humour. Note that some of the contributed macros above will solve some of these problems, but they still remain the de facto test of skill for voice work :-)

From: dana@sybase.com (Dana Bergen)

Announcing the first-ever competitive event designed to show off the special talents developed by DragonDictate users!

----- Speed Category: The Multiple-Headset Shuffle

This event is for DragonDictate users who also use a telephone headset to reduce neck strain. The telephone rings, and the user must do the following:

- 1) say "voice console", "go to sleep"
- 2) remove microphone headset
- 3) remove music earphones
- 4) put on telephone headset
- 5) say "hello"

All five actions must be completed before the caller hangs up or voice mail picks up the call!

----- Physical Dexterity Category: The Coffee Ballet

In this event, the user must drink a cup of hot coffee while using DragonDictate. Points are deducted for:

- bumping or moving the position of the microphone
- burning one's mouth
- dribbling coffee down one's face
- spilling coffee on one's lap
- spilling coffee into the microphone

----- Vocal Dexterity Category: Sending Private Email

The user enacts the following scenario:

 You have just had a fascinating new sexual experience. You
want to tell your friend, who lives in another country, all about
it without paying for a lengthy long distance phone call.
Describe

your experience in detail using DragonDictate, speaking loudly enough for DragonDictate to function but quietly enough that your co-worker in the next cube can't hear you.

Dramatic Talent Category: The Pantomime

A new employee drops by to talk to the DragonDictate user. He doesn't know about DragonDictate and believes the user is on the phone. The user must convey the concept "no, you're not interrupting me, just a second" before the visitor turns and walks away, without causing any erroneous keystrokes to be typed.

:-)

How Easy is it to use DragonDictate ?

From: Dana Bergen

>I had a demo of DragonDictate today. I have a couple of questions,
>though. How easy is it to install and learn? The reseller wants what
I >consider a hefty chunk of money (\$250 to install + (\$250 x 2 for
two >4-hour training sessions) = \$750 total) to install and train me
on it.

This is insane. You don't need anyone to train you on it. It comes
with a tutorial and it's not difficult to use. The "more advanced"
features like creating macros and using dcoms are reasonably well
explained in the manual.

>I'm pretty comfortable installing things in my PC (I put in a sound
>card and a tape backup unit myself), but he was talking about
>configuring interrupts, which I know nothing about.

I didn't install the card myself because my hands aren't up to using a
screwdriver but I don't think it's any big deal. I think that
configuring the interrupt is just a matter of setting a switch on the
board. If you're on a network there are some additional issues. If
you're concerned about this you might try negotiating a much lower
price for him to just do the install. Better yet, try it yourself and
only pay for help if you get stuck.

>following a tutorial and reading a manual. On the other hand, I want
>DD to work, and I want to feel comfortable using it, otherwise it's a
>waste of \$\$\$.

With respect to the installation, it will either work or not work.
It's not going to work badly or differently because you installed it
wrong.

I think your reseller is trying to recoup the money he's not making
since they cut the price.

DragonDictate Upgrades v2 to v3

From: taylorw@marie.mit.edu (Washington Taylor)

Joe Steffen writes:

I moved my DragonDictate 2.0 voice files to a PC with DragonDictate
3.0 and converted them with the modvoc program that's used for
upgrading to 3.0, then used DragonDictate in my normal work for a few
hours. Modvoc copies all your words and macros and preserves your
voice training, but it still has a few problems:

1. Word punctuation attributes are not preserved, both for words you
added and special character punctuation you changed, e.g. I changed
"*" to cling left and right so it's easy to use in file name and
regular expressions.

Do you keep most of your macros in files? If you do, it is easier to
keep track of and edit them. Furthermore, when you upgrade you can
simply edit those files to the new format and fix punctuation
automatically. I haven't upgraded to 3 yet, but even upgrading from 1
to 2 it only took a few minutes to write emacs macros to update my
macro files.

2. Trailing spaces on words are removed. This is a problem for me
because I define most computer command names to have a trailing space
and cling right so I can say "*" after them.

Again, this problem would be fixed by using macro files. If the internal representation changed, you could use a command like add-word /t /g "foo" "foo " r (version 2 syntax)

I went through the first part of my vocabulary online and counted over 170 words such as file suffixes like ".bat" and parts of file paths such as "../". I estimate I have over 200 such words and special characters with changed punctuation attributes, so unless modvoc is fixed I'm not spending the money to upgrade. Note that there is no way to dump words in DragonDictate 2.0 so all of the above has to be corrected by voice.

Again, using macro files would eliminate this problem.

I had the same error rate (3%) as with DragonDictate 2.0. Has anyone seen an improvement in recognition accuracy after upgrading from 2.0 to 3.0?

I had 98% recognition with version 1. I have 98% recognition with 2. I expect to have the same with 3 and the windows version unless they have radically improved something. The only difference was the time to reach the plateau, which was months for 1 and days for 2.

> From: "Susan Maller ()"

> Has anyone out there upgraded from Dragon 2.0 or 2.01 to Dragon 3.0?
> How do you like it? Do you notice a significant difference? PLEASE
> REPLY. Susan Maller maller@madonna.coedu.usf.edu

Yes, I'm on 3.0 Classic - still with a 30K vocabulary. I found that recognition has improved, particularly for words like "last" "cast" "castle" in which the British flat "a" caused a problem. I no longer have to try to sound like an American on these :-)

Also slightly faster, I think, but that is subjective and I have no proof. So, no significant difference but I'm happy with the upgrade.

[Return To Contents List](#)

What Sound Cards Can I Use ?

DragonDictate for DOS uses the IBM M-Audio Acquisition and Playback Adapter, M-ACPA, which is an ISA-based card. This card is used for digitizing the audio and for doing FFTs on the digitized samples to assist recognition and reduced the CPU load. Read on for further information about these cards and the cards used by the windows version...

From: Scott@ccgate.dragonsys.com

>Also, (forgive my ignorance being a non-PC oriented person) could
>someone tell me whether there is a PCMCIA, or PCI M-ACPA card
>available, or a similar card which DD can use ?

There is not a PCMCIA version of the M-ACPA card. At this time, DragonDictate for DOS can only use this card. As you may have gathered from reading the mailing lists, DragonDictate for Windows can operate on a Windows sound card like a SoundBlaster 16, the MediaVision PAS16 and the Microsoft Windows Sound System to name a few.

[Return To Contents List](#)

DragonDictate for Windows or DOS ?

From: Jack

>> but in my opinion, the technology just isn't there to >>give you both adequate performance and to also have the DragonDictate menu pop >>up on the workstation screen.

>I'm puzzled by this remark. I have the DragonDictate menu on my workstation >screen, and the performance seems quite adequate to me. (The accuracy, on the >other hand...but that's a different topic.) Do you mean that >you experienced a noticeable delay between saying a word and seeing it >typed, or that you had to wait for menus to be drawn? This has not been >my experience. Or do you mean that you can speak more quickly if the >menu is not exported?

What I mean is the following. I regularly use Dragon to run an X display. The way I'm using it is to have a PC monitor next to my workstation monitor. After using this for about 1 1/2 years or so, (the point being that I had become accustomed to a certain level of performance) I saw a demo of the Windows product. Point blank the performance was visibly worse than what I am used to. I surmised that the reason for this was that the Windows display takes processing power to update, which is true. The Dragon Systems rep basically agreed with me, though he was surprised that I noticed. The main thing is, anything you ask the PC to do other than voice recognition is taking cycles away from the recognition engine and giving them to some other task like updating the VU meter, for example, which is constantly responding to the volume of your voice.

Someone else said they didn't think that the Windows version was slower, and then went on to explain that they were already using an exported menu that appeared on their actual workstation display and explained that since the exported menu was already taking a certain amount of processing power, that the additional amount required to update and maintain the Windows display was insignificant compared to what they were already putting up with.

My problem is that I could easily see that the Windows version was slower than what I was using; since what I'm using needs to get faster, not slower, this is not a solution I am willing to consider. Also, since I rarely have to look at the PC screen anyway as I just watch what happens in my X display, the benefit of running on a single machine or of having an exported menu pop up on my workstation (and cause the problems mentioned on this list with blotches due to bugs in deskview/X) is of little or no use to me. What I want is raw performance, period. Anything that will adversely affect that, and I could easily tell from the demo that the Windows display would, is just not going to make it with me. Added to that, the Dragon rep basically admitted that it *was* slightly slower, so I basically bailed on the Windows product. This is not to say that I'm not into DragonDictate; I am, it saved my career. I just won't do anything that will slow my scenario down.

From: steffen@iexist.att.com (Joe Steffen)

I installed DragonDictate for Windows last week. The first problem is you have to cancel the new user dialog and follow the README instructions to change the voice board default to the M-ACPA board.

The second and worst problem is you can only transfer some macros from DragonDictate for DOS; you lose everything else: voice model training and all added words (I have a significant number of acronyms and UNIX

command names and options). After two calls to technical support it wasn't clear which macros can be imported into DragonDictate for Windows; the format of special keys like control keys may have changed, so you will need to write a conversion script. You can't import macros with dcom's because they are replaced by a scripting language.

The third problem was the tutorial quit after an internal error 4 times. After doing the quick training, the tutorial finally worked. DragonDictate for Windows operates differently so retraining yourself will be necessary, e.g. you say Voice Menu instead of Voice Console. I'm sure you can define a compatibility macro, but the macro language documentation is on-line and not in the printed manual, which I consider to be a problem since it is easier for me to read a paper manual then control a help program by voice.

So now I'm considering upgrading to DragonDictate 3.0 since I will continue to use DragonDictate for DOS for most of my work, which is on UNIX and a Macintosh.

From: Sebastian Seung

I just got my DOS to Windows upgrade from Dragon Systems. The user interface is well done, but the documentation is not so good. My greatest disappointment is that it doesn't work with PC-XWARE. I called Dragon's technical support, but they were ignorant of the problem. Does anyone know the reason for the incompatibility? Or has anyone else found a compatible X terminal program for the PC?

DragonDictate vs Kurzweil Voice

From: George Hu Subject: Kurzweil Voice

I am fortunate to have both Dragon Dictate and Kurzweil Voice for Windows, and would like to provide some comparison. It seems that Dragon really dominates this mailing list, possibly due to having multiple dealers on the alias. While Dragon is a very good product which has developed many features which are very useful, Kurzweil has some advantages which everyone should examine.

In my opinion, Kurzweil has a much better recognition engine. Out of the box, Kurzweil beats a trained Dragon, and over time it still beats Dragon. When I use Dragon, I find it mistakes words a lot, and often doesn't have the right word in a choice list of 10 words. Kurzweil, however, very rarely makes an error, when it does make an error it is usually on a word which does sound ambiguous, and the choice list of 5 words has the correct word in the list much more often. Dictating this whole document, I probably made less than a dozen errors! Kurzweil is also faster than Dragon on the exact same system. This may be do to Kurzweil still using a specific hardware board whereas Dragon is running off of a Windows sound system card. These two advantages mean that I want to use Kurzweil, but do not look forward to using dragon.

Dragon has a much better set of macros and customization. If you intend to do programming, or other non-dictation activities, Dragon may be the only system which can work for you. Dragon allows you to control the mouse and buttons by voice whereas Kurzweil does not. Dragon can read text off of buttons and allow you to speak them whereas Kurzweil only has a few predefined buttons you can say. Dragon allows you to create hierarchical macros and has sophisticated things you can do inside macros such as control spacing and

capitalization, Kurzweil does not.

Kurzweil is a simpler product to use. There is no command vs. dictate mode. There are no flags for spacing and capitalization you have to set before saying a word. Kurzweil allows you to correct spacing and capitalization afterwards. For correcting errors in previous words, you don't need to enter a special oops mode; you just say " backup 2" or whatever. Kurzweil has a manual of about 70 pages; Dragon comes with three manuals totaling over 315 pages. Kurzweil also comes with many application macros which I have found easier to use than for Dragon, although that probably varies a lot depending upon which programs you run.

Eventually, Kurzweil will probably have all the features of Dragon. It will be difficult, however, for Dragon to change their whole engine. Eventually, both these products will be put out to pasture by continuous recognition systems. Today, I think the choice is between recognition accuracy, and features. If you want a dictation system for actual English dictation and moderate application control, then Kurzweil deserves serious attention. If you intend to do programming, or other things which must be highly customized, then you probably need the features of Dragon.

Lastly, Kurzweil is retailing at about 1000, which is a bit more than Dragon. Both systems can run on similar platforms, but I think Kurzweil is faster. Sometimes, Kurzweil can require more virtual memory than Dragon, but both are basically memory hogs. I run both on a 66 megahertz 486 with 16 megabytes.

From: Gary R Noonan Subject: Re: Kurzweil Voice

My approximately year long experience with the DOS version and approximately 2 month experience with the Windows version of Kurzweil support the comparison provided below. The Dragon dealer was unable to make his system perform with anywhere near the accuracy of Kurzweil when I examined DOS systems. The Windows version of Kurzweil is indeed very good at voice recognition--even without training.

I recently found a method to have Kurzweil produce mouse clicks on selected windows. Simply start the Windows Recorder macro system (found in accessories window) and assign unique keystroke to the macro (such a Shift + Alt + Ctrl + a) and make the desired mouse clicks. Then create a macro in Kurzweil that issues the hotkey for the Windows Recorder macro. This procedure allows you to have the Kurzweil system perform mouse clicks by voice. You can of course also create macros within individual programs and have Kurzweil call them. I have created numerous voice activated macros in WordPerfect for Windows and call them from Kurzweil, often performing complex tasks with a single voice command.

DragonDictate vs IN3

From: Dana Bergen

>> I've been looking into IN3 and am considering buying it. However, there >> is no demo version, and no money-back guarantee. So as far as the >> company is concerned, I have to put down \$700 sight unseen with no >> guarantees. Is there anyone in the Boston area (I'm in Waltham) who is >> using the product and would be willing to give me a short demo so I can >> get a better feel for this product before plunking down \$700?

IN3 costs \$700? Why spend \$700 for a limited command set when you can

get a full-fledged dictation system (DragonDictate) for \$1000?

I have no financial interest in this recommendation. I use DragonDictate and a coworker used to use IN3, and they are in two completely different leagues. I don't understand how IN3 can get away with charging that much given what DragonDictate costs now.

From: Nelson Sproul

>> I just got DD for Windows to use it with Unix. I don't know how smart that was >> (I'm beginning to wonder if I should have gotten IN3)...

you are better off with DragonDictate than in3.

when my hands first went bad, I wasn't aware of the DragonDictate/a2x option. Despite warnings from in3's customer service that I would "go crazy" using in3 as a substitute for typing (as opposed to just using it to handle mouse functions), I used in3 for one year, getting barely acceptable performance with a vocabulary of about 150 items. This vocabulary allowed me to spell words out, which was of course an excruciatingly slow method, though one I was still grateful for since it allowed me to continue work in this field.

Now, using DragonDictate, I have superior performance AND a vocabulary of 30,000 items. I mentioned this to an in3 rep, and all he could say was that my Sun, a sparc ipc, is not a very strong machine. I don't think this accounts for a difference in performance/utility of two orders of magnitude. I haven't seen in3 run on a PC, but I called Command Corp. (in3's manufacturer) today and they say in3's performance is comparable on the two platforms. I also asked what was the largest vocabulary size they would expect, and I was told "at least a couple hundred."

Needless to say, a vocabulary limited to hundreds of words is not acceptable for an English dictation system for adults. I have never flamed anyone/anything in my life, but it appears to me that, given the availability of DragonDictate and a2x, in3 is a hoax.

From: Nick Parker

Nelson Sproul wrote: never flamed anyone/anything in my life, but it > appears to me that, given the availability of DragonDictate and a2x, > in3 is a hoax.

I can see how using IN3 for text dictation would be very frustrating. I'd compare it to chopping down a tree with fingernail clippers. It's possible, but geeeeeeeeeeeeez! It's certainly unfair to complain afterward about the design of the fingernail clippers...

I've never seen INCUBED represented as a "dictation system." It certainly isn't called that in the Command Corp marketing literature I received, nor in the IN3 product documentation I received when I bought the package.

It's all a matter of selecting the right tool for the job. Almost all applications require a large amount of command selection -- that's the nature of graphical user interfaces, and feature laden software. When you count up cuts and pastes, font changes, saves, moves, etc, even writing a simple text document has a LOT of command and data selection. In the case of CAD, DTP (which is almost indistinguishable from word processors these days), or other similar applications, the user-computer interface is comprised almost entirely of command and data selection. A good voice command system, like IN3, can perform these functions via voice, and drastically reduce the amount of button pushing you do in a day. A continuous dictation system might do the same, but at a much higher cost. Both dictation systems and command systems have their place -- it's a matter of selecting the right tool

for the job. Command systems will benefit everyone, and dictation systems will give an additional benefit to those who need it.

I don't think IN3 is a "hoax" -- at all. It is very robust and effective software. The last literature I saw lists the prices at \$179 for the basic version, and \$395 for the Pro version, which includes a very nice Audio Technica Pro 8 headset microphone. Not bad. And no, I don't have any affiliation with Command Corp. I'm just a satisfied customer: IN3 did what they said it would do.

From: Ann Marie Lawler

> IN3 costs \$700? Why spend \$700 for a limited command set when you
> can get a full-fledged dictation system (DragonDictate) for \$1000?

Well, that's IN3 plus a top-of-the-line noise-canceling microphone.

If you're on MS-Windows, IN3 doesn't cost anywhere near \$700 and if you're on a SPARC station you've got to add the cost of the PC, the sound card, and possibly the communication connection to DD. Maybe you've got a free com port, maybe you don't, it's just that much more hardware. That plus find a place for that second box, and keyboard, and screen... Sigh...

Then you also have to get a2x running. According to the documentation with the copy of a2x that I have (distributed with the X11R6 sources) it won't work with the Sun OpenLook version 3 (current release) out of the box. You have to have X11R6 running or a patched version of X11R5 with the XTEST extensions patched in.

> I have no financial interest in this recommendation. I use
> DragonDictate and a coworker used to use IN3, and they are in two
> completely different leagues. I don't understand how IN3 can get
> away with charging that much given what DragonDictate costs now.

Well, IN3 and DD are in different leagues. They are different products designed to do different jobs. One is a command system, one is a dictation system. I type just great. In fact, some of my co-workers think I type faster than I talk. My typing was not where my problems were starting. If you can't type at all I guess you need a dictation system. If you can still type and want to prevent further damage, maybe a voice command system is a better choice. One product is not necessarily better than the other, they're just designed for different jobs.

My problems started with that darn rat (ahhh... I mean mouse). When you squeeze both sides and hold down a button while dragging something around on a desktop, the stress goes right to the wrist. Added to that were multi key cords. ~F and ~B in vi as well as some of those lovely Alt-Function keys for Wordperfect had me stretched accross the keyboard like I was palming a basketball. Ouch!

If your hands are already so injured that even normal typing is no longer possible, I'm sorry to hear that and I guess you don't have much choice. I prefer to not get that bad. I replaced all the fancy command operations with voice macros. Now my typing doesn't bother me at all. I can even type faster than I used to because I've reduced some of the distraction when doing commands. I caught my problem early enough so I guess I'm one of the lucky ones. I'd rather do the commands and functions by voice and still type rather than be forced to do all of my typing by voice.

From: Simon Crosby

 > use and designed for the purpose to which they are applying it.

On the other hand, a2x is not a product, nor does it claim to be. It solves a problem, and does it exceedingly well. There are lots of people out there (like me) who cannot type. My career would be in the dustbin (US = garbage can) by now if I were not in a position to:

1. Write technical documents 2. Write programs in lisp, C, assembler and various other gunk 3. Manage a computer network All by voice, on a unix workstation. DD is the ONLY product which I have seen which will currently allow all of these, in spite of its flaws.

> Actually, according to the sources, a2x has some pretty fancy
 > features > built into it that many people don't even know
 > about. Maybe because they > are so archane to try and figure

 > the fly > is difficult at best. And the recognizer still
 > doesn't know what's happening > on the screen or if something
 > succeeded or not. Then there's that extra > box and screen
 > and keyboard and sound card...

Yes, a2x needs a language front end, and DD needs to be "application context aware". It also needs a *much* better undo mechanism than its current "throw out backspaces" idea. Ideally voice recognition/input should be an integral part of each application to guide recognition and so on ... One of these days perhaps... But remember, a2x is free. It also works well enough in conjunction with DD to be very useful.

> The thing about IN3 is that it is easy to setup and use and to

 > failure of a previous >function.

Great. I have no problem with IN3 -- If it solves a problem or has a niche, then I'm 100% behind it. Remember though, that not everyone has a sparcstation. What do I run on my alpha box ?

> It might be possible to combine key bindings with piles of shell >
 > scripts and come close to some of the advanced features of

 > really want to spend all of that time writing clever > shell
 > scripts to go with all those clever key bindings? Just to do
 > a few > of those things which key bindings cannot do? Just to
 > use a product for > something it was not designed for?

No I don't want to spend hours doing this. I spent about 1.5 weeks, once, and now I can do almost everything I need. Admittedly not very sophisticated, but it works. If you can add value in a product and people will buy it, then great. I wish you the very best of luck. And yes, I'm sure you have fantastic functions which I'd love to have.

> If you need a dictation system, get a dictation system. If you
 > don't > need a dictation why get one to do something other
 > than dictation? Different > products for different jobs.

My DD world is more than a dictation system, it is my whole human-computer interface. This may well be true of IN3, now or someday, and I agree IN3 can help save people's hands by reducing hand strain.

What helps / hinders recognition ?

From: steffen@iexist.att.com

>From att!x.org!pub-mailer Mon Sep 19 17:19:33 1994 From: dorab@twinsun.com (Dorab Patel) To: a2x-users@x.org Subject: what helps / hinders recognition

The recent discussion about hoarseness and recognition efficiency during a cold reminded me of a question I've been meaning to ask...

In your experience, what do you find that helps recognition accuracy? What seems to hinder recognition accuracy?

I keep my office door nearly all the way closed, otherwise the higher background noise increases errors. I'm vigilant about correcting misrecognitions and if I ever leave the mike on during a conversation so there are more false recognitions than I can correct, then I revert to the last saved voice models; otherwise your voice models get messed up and your error rate goes up until they are retrained. I keep track of common misrecognitions of voice macros and change one of them even if I've used one of them for a long time so my mental retraining is difficult. For example, [quit UNIX] often sounded like [quit emacs] so I changed the former macro. In 11 months my error rate dropped gradually from 8% to less than 3%.

How About DragonDictate for the Mac?

Articulate Systems' licence DragonDictate for the Mac, and the product is called PowerSecretary. Anyone with a review please let me have it. Articulate Systems: +1 617 935-5656

From: "Gary L. Karp" Date: Tue, 1 Nov 1994 06:54:27 GMT

A brief update on my recent post on the PowerSecretary dictation system for the Mac from Articulate Systems.

I had understood it was necessary to dictate into a separate window and then copy into the application. This has turned out to be only partially true. One may dictate into any application, but cannot correct by voice unless they work in the separate window.

The good news is, an update will release in November which corrects that. It will be possible to dictate and correct in any application window.

I feel confident based on discussion with Articulate that they are committed to eventually meeting the full set of Dragon features on the Mac. I will be getting the system, and will report as I get it running.

It will remain necessary to have a minimum 040 system. I am getting a PowerPC. It will also run on PowerBook 540s without added boards or peripherals - except the microphone, of course.

A company in the Bay Area, Scott Tech, has a solution whereby Dragon is pumped through a small PC and out to a Mac in ADB format. This remains the answer for pre-040 Macs.

DragonDictate and Notebook Computers

From: Scott Jangro

>From: Bob Wentworth

>I just talked to Dragon technical support about using Dragon on a >notebook. >They say that most notebook sound systems don't do a good job of >emulating industry standard sound boards, and that Dragon does not >work well on these. However they do know of one notebook that is >100% compatible with the Microsoft Windows Sound System. Dragon >works fine on that. FYI, Dragon is at (617) 965-5200.

To save you a toll call, here is the Windows Sound System compatible sound card that I think somebody here told probably told Bob about:

WAV Jammer PCMCIA sound card New Media Corporation Irvine, CA
800-CARDS-4-U

This is not an entire notebook solution but a PCMCIA card that will plug into a notebook with a PCMCIA slot. We have tested the card here at Dragon and it does work very well with DragonDictate for Windows. It is a Windows Sound System compatible card and like the real Windows Sound System, it requires the use of a condenser type microphone (as opposed to a dynamic microphone which is what we've traditionally shipped with DragonDictate). We do provide either type microphone with the DragonDictate for Windows.

It is true that some sound card emulations do not do a good job at mimicing the real thing, but I would not say that it is necessarily *most*. The truth is that we don't yet know if most of them will work or not. The point is that one shouldn't assume that a card is truly Windows Sound System compatible (or SoundBlaster 16 compatible) just because it says it is. For example, it may allow you to run Windows Sound System's software drivers but the electronic characteristics of the hardware may not be of the same quality as the real Windows Sound System. While this work well enough to do recording and playback in Windows or to play WAV files, this may not work well on a technology like speech recognition that relies heavily on good quality sound.

As far as information on any other sound cards goes, we are in data collection mode right now. We do rely quite a bit on user feedback for this infomration in addition to our own testing so if you have any information on notebooks or sound cards that work well or not with DragonDictate for Windows, I'd like to hear from you. Thanks.

From: Scott Jangro

We're currently putting together lists of laptop computers that work well with DragonDictate for Windows

The company that you called has no connection with Dragon. That company is unique because they have a laptop that can accomodate an ISA card. This is important for people who use the ACPA DSP card for

DragonDictate (required for the DOS product). Therefore, we refer customers to them as the only vendor that we know of with this kind of laptop. FWIW, I apologize for the difficulty you had in contacting them.

Now that DDWin can run on a standard Windows sound card, we have many more options. We're currently running experiments on different systems to put our seal of approval on some laptops that provide the best quality performance. Speech recognition is a very specialized use of sound input and requires high quality speech samples for good performance. Many sound cards just do not provide the quality sound that we feel is important for our product to perform the way we know it can. So while most if not all 16 bit sound cards would pass the "go-into-the-software-store-and-see-if-it-runs" test, only a subset of those would produce the quality sound for good speech recognition. It takes hours and hours of testing per card or laptop to determine this level of quality and we will provide this information to you as soon as it is known to us.

At this time I can tell you that users are running DDWin successfully on the following computers. We have purchased these machines and are in the process of certifying them. We DO NOT guarantee them at this time but preliminary tests are promising.

Toshiba 4800 DX4-75mHz Everex Stepnote DX4-75mHz Ergo 100mHz IBM Thinkpad 755 WAVjammer (PCMCIA card)

How About DragonDictate for Windows NT?

From: Simon Crosby

A person in Cambridge suffering from early stages of RSI wants to know whether there is a DragonDictate in the pipeline for NT. Anybody know?

Also, has anybody done the equivalent of a2x for NT? I mean, PC doing the recognition and an a2x-like thing on an NT box. Is this possible (thankfully I have no knowledge of windows or nt)

From: Hans Heilman

>> Also, has anybody done the equivalent of a2x for NT?

There is a hardware solution called a TTAM that takes ascii output from one PC and converts it into the correct electrical interface to go into the keyboard port of a second PC. It also does mouse emulation going into the second PC's mouse port. I think this is the configuration:

A friend of mine has been using this setup for a while so he could use Dragon for Windows development, before the DDWIN release (he was willing to live with having to have 2 PC's). As an experiment, he swapped the righthand PC to be one running NT and everything seemed to work fine.

The TTAM is around \$400 -- a company called something like Prentke-Romich sells it (along with other assistive technology). If you send me mail, I'll get the real name and address.

From: dana@sybase.com (Dana Bergen)

You couldn't control the mouse by voice with this setup, could you? Because Dragon for DOS doesn't have that capability.

From: dp@world.std.com (Jeff DelPapa)

If you have a PS/2 mouse, the ttam will control it. (takes special key sequences, but they can be done as voice macro's) The one I had (it is currently on extended loan) also had a MAC ADB connector, and could spoof both keyboard and mouse on that machine. Mine was made by Words+ in northern CA (who make lots of adaptive products) but they have since stopped. The box was originally designed by the Trace Center at UWisc/Madison, and was licensed to several vendors.

Having said all that, there may be a minimal hardware solution. Under DOS, and Windoze 3.1 there is a "handicapped access pack" (available free for the asking from IBM and Microsoft respectively) One of the many things it provides is "serial keys" a setup that lets the keyboard and mouse be driven by data on the serial line. (you send "sentences" to access characters outside of the normal printing ones)

I don't know if NT has such a facility, but since it was developed after the access pak became available, they may have built it in from the start. If someone has the NT doc set and wants to take a quick look, it would be appreciated. (I will be looking into this myself shortly, a co-worker will be in this spot soon)

All of these presume a two computer solution. In the case of NT, with suitable software, you can use the DV/X trick and get the menu's to share the main screen. (dragon/dos won't run in a less than full screen ms-windows dos box, the video emulation isn't good enough).

In the case of the TTAM, it does not support ps/2 scan code 3 keyboards (unfortunate, as that is the code set that many X terms that adopted PC keyboards use), so check yours. The vanilla PC (big 5 pin plug) keyboards are fine. The program to convert key events to the sentences needed by either ttam or the access pack does not exist in the public domain. The Word+ people used to include a copy if you bought a ttam, but they wouldn't sell it separately, and it may be essentially unavailable now. I don't know what the others do.

From: dp@world.std.com (Jeff DelPapa)

I am glad we have the windoze NT documentation in machine searchable format. NT does indeed have a handicap access pack available for it, the page that tells you how to get it is in the appendix of the SNA Server development kit installation guide (I kid you not). Anyhow it is /softlib/mslfiles/wn0789.exe on ftp.microsoft.com.

I got a copy, but haven't tried it yet. (toby will do so on monday). Since I have the disks, I suppose I should try installing dd/win on NT and see what happens.

From: Hans Heilman

One place I know the T-TAM can be ordered is:

Prentke Romich Company 1-800-262-1984

Their catalog carries a number of assistive devices, and also sells the T-TAM, apparently to connect their assistive devices to a PC (although it can also be used to connect 2 PC's together). They have

Do you get hoarse from using DragonDictate ?

From: rbd@sst.ll.mit.edu (Robert B Dunn)

I am looking for some advice on using DragonDictate. The problem I have (which I think is fairly common) is that I get hoarse fairly quickly. Unfortunately this happens so quickly that I have not been able to make much use of DragonDictate and a2x, although I have had them for a few months. I now frequently get hoarse during normal conversations and occasionally have to stop talking to people. I use the following strategies to reduce the stress of using DragonDictate:

- 1) speak softly,
- 2) drink very frequently.

The following summary of a discussion of hoarseness was made by Scott@ccgate.dragonsys.com (Scott Jangro).

++++++Original E-mail

Posting+++++++ I have been reading peoples' summaries of their experience with voice input for performing programming and related tasks, since I have considered use of this technology myself for a worsening RSI problem. It all sounds quite encouraging. However, at this time I have a few questions/concerns perhaps someone can address:

- 1) have the users of voice input at work found that their talking disturbs their officemates? Has anyone needed to arrange for having an office to themselves? It seems that when office space is limited this may pose a problem.
- 2) has anyone experienced hoarseness or similar problems attributable to the increased talking? Is it possible we may be partially substituting one problem for another?
- 3) speaking of hoarseness, how do Dragon and the other packages perform when the user has hoarseness due to voice strain or a cold? Does recognition suffer significantly?

Any insight on these questions would be appreciated. Thanks!

+++++

- 1) have the users of voice input at work found that their talking disturbs their officemates? Has anyone needed to arrange for having an office to themselves? It seems that when office space is limited this may pose a problem. ----- this can be a problem.

- 2) has anyone experienced hoarseness or similar problems attributable to the increased talking? Is it possible we may be partially substituting one problem for another?

No problems...

- 3) speaking of hoarseness, how do Dragon and the other packages perform when the user has hoarseness due to voice strain or a cold? Does recognition suffer significantly?

I've found that if I already have a sore throat, working by voice can aggravate it. However, I have not had recognition problems even when *completely* stopped up (as in runny nose, congestion, etc.).

++++
>their officemates? Has anyone needed to arrange for having an office
to >themselves? It seems that when office space is limited this may
pose a >problem.

I work in a cubicle. Most of the people around me say that my talking
is "white noise" that doesn't bother them. Apparently one person has
complained, and as a result I may be getting a private office (which I
wouldn't normally rate) when my group moves in a month for two. If
this happens I'm certainly not going to complain :-)

>2) has anyone experienced hoarseness or similar problems attributable
>to the increased talking? Is it possible we may be partially
substituting one >problem for another?

I had really bad voice strain the first day or two, but I changed the
way I was speaking and the problem went away. I had taken a singing
class and been taught how to project without straining my voice. When
I used that technique I stopped having voice strain.

>3) speaking of hoarseness, how do Dragon and the other packages
perform when >the user has hoarseness due to voice strain or a cold?
Does recognition >suffer significantly?

I have allergies and my level of congestion varies a lot. Mostly it's
not a problem. Sometimes on a particularly bad day I notice the
recognition being a bit worse, but it's not a real big difference. I
have two frequently used macros, [sniffle] and [clear throat], which
don't type anything. They work really well!

Here's the mail I sent in response to the original inquiry, since
people other than that person seem to be interested:

I'm a Senior Software Engineer at Sybase. I do new feature
development on the SQL Server, which is our core product. I
investigate problems, write specifications documents, write code, and
fix bugs. My work is in C in a Unix environment.

I use DragonDictate all day long. I can't type at all without pain,
so I do everything with DragonDictate. I think that the effect on my
programming productivity is minimal; i.e. I get pretty much the same
amount of work done with DragonDictate as I used to get done typing.
It's a little more of an impediment when writing a document; I create
documents somewhat more slowly than before. However, I'm perfectly
capable of doing what's needed for my job. I was a very fast typist;
DragonDictate makes me more like a fairly slow typist. There are
plenty of engineers here who are not super fast typists who do a good
job. My company expects the same amount of work from me that they
expect from other people, and this has not been a problem.

There was a pretty significant amount of time required to get going
with DragonDictate in a Unix programming environment. Getting the
various pieces of software and hardware working together correctly
took some doing; getting macros and such set up took some doing;
getting used to using DragonDictate took some doing. I spent a fair
amount of time after hours working on my environment for the first
month or two. During that period of time, I was doing my job using
DragonDictate but wasn't as productive as I am now with it.

++++
1) have the users of voice input at work found that their talking
disturbs their officemates? Has anyone needed to arrange for having an
office to themselves? It seems that when office space is limited this
may pose a problem.

> > > I have found that I can dictate pretty softly, and it seems to work better that way anyhow. Outside noise doesn't seem to disturb DragonDictate much, though. Classical music is just fine, as are conversations in the hallway, but it doesn't seem to like Devo music! As for disturbing my neighbors, as long as I talk relatively softly, that doesn't seem to be a problem (no worse than having a neighbor who spends all day on the phone, which is normal for some environments). I think privacy may be more of an issue: you need to realize that now people can hear you writing your email! (Already a problem with phone conversations).

2) has anyone experienced hoarseness or similar problems attributable to the increased talking? Is it possible we may be partially substituting one problem for another?

> > > Yes, hoarseness is a problem. Much better when I talk softly, which is desirable anyway. I also drink a lot of water and tea. You should treat it like typing -- don't do it for hours without stopping once in a while for a break. When I first got the system, my head, neck, and shoulders bothered me more, until I realized that I was essentially shouting at the system (like teaching a class without a microphone and trying to project all the time). This is less of a problem now that I've learned that it works just fine with soft speech.

3) speaking of hoarseness, how do Dragon and the other packages perform when the user has hoarseness due to voice strain or a cold? Does recognition suffer significantly?

> > > Yes, it does suffer. It's really fun to dictate while crying! :- (You need to be sure not to save your voice files after such a session so as not to screw it up. It does still work, though.

Any insight on these questions would be appreciated. Thanks!

+++++

hoarseness has not been a problem for me, even when I was pulling a lot of all-nighters last summer/fall.

the following will help keep you going longer:

1) sip water frequently, and don't wait for your throat to get dry before you get something.

2) speak softly and steadily

3) avoid drinks with caffeine or the harsher pops. (I don't know what the mechanism is, but avoiding caffeine was suggested by a friend who is a singer. I did find that my throat would feel dryer and more irritated if I had had a lot of pop and I had been working at the computer.)

There are many professions where people use their voice all day. Its good to get suggestions from them. We have an advantage, because our voices must only carry to the microphone.

+++++

1) have the users of voice input at work found that their talking disturbs their officemates? Has anyone needed to arrange for having an office to themselves? It seems that when office space is limited this may pose a problem.

DragonDictate is sensitive to noise, particularly to drawers and binders closing, although you can train an empty macro to these sounds it does interrupt and slow you down. I think a private office is important; don't be afraid to mention the American Disabilities Act.

2) has anyone experienced hoarseness or similar problems attributable to the increased talking? Is it possible we may be partially substituting one problem for another?

I sip water all day and have had problems with hoarseness only when I let my cup stay empty. Drinking water also forces me to take breaks to go to the restroom.

3) speaking of hoarseness, how do Dragon and the other packages perform when the user has hoarseness due to voice strain or a cold? Does recognition suffer significantly?

DragonDictate works surprisingly well when my voice sounds different from normal.

+++++

> 2) has anyone experienced hoarseness or similar problems
> attributable to the increased talking? Is it possible we may be
> partially substituting one problem for another?

I am responding to this question because I have had a particularly bad experience in this area.

I began using Dragon extensively at the beginning of this year. After a couple of months, I noticed my throat was getting sore each time I used it. Being a performer in amateur theatre, I found that I was having to quit using Dragon by Wednesdays so that my throat could recover for a weekend performance. (In a dozen years of singing and acting, I have never experienced voice problems from performing.)

The problems persisted and worsened. I asked our medical department if a voice therapist could be brought in to see what I was doing wrong. Nine weeks of aggravating bureaucracy later, I saw an ENT (ear, nose, throat) doctor who told me I had nodules on my vocal cords. I immediately stopped using the system.

While the nodules have since faded away, I continue to have pain in my throat from speaking (regular speaking). So now I can neither type nor talk comfortably.

There is one other person here that uses Dragon, and though he is able to use it, he, too, had some much less severe throat problems along the way. Even now, if his allergies act up, he has some difficulty.

I am glad to hear that others have not had much problem with this, but be advised that it can occur. This possibility is also noted in the best book on RSI we have yet to find, on p. 168 (RSI A Computer User's Guide, by Pascarella and Quilter).

Subject: gnu-tools/sim/terp execloop.c

Update of /p/cvsroot/gnu-tools/sim/terp
In directory calliope:/N/auspex/root/s6/lisa/src/gnu-tools/sim/terp

Modified Files:
 execloop.c

Log Message:

- Removed check of dcachep->needs_copy; gave up on this optimization.
- When cache tag becomes dirty, record the tag write for hazard detection.
- When data_access() returns failure status, clear last_regs/last_thread.
- Changed E_TPROT exceptions to F_IFETCH or F_BRANCH, depending on context, so that the real exception is given from within insn_fetch().
- Near top of loop, trace the register commit for the previous instruction (if last_regs is not NULL).
- When updating register scoreboards for current instruction's destination(s), record current reg_ptrs and thread in last_regs and last_thread.
- Moved check of hth_da_incomplete so that we don't miss any cycle-counting code -- just want to avoid (re-)counting the instruction.

Subject: current thru the power poles

I did some calculations on the power thru the power poles.

1. max possible current thru 1 pole at 1/5 power power poles are spaced every 5 atoms along a spar. there are two flavors.
vdd and vss
each flavor then services ten atom rows. at 1/5 power, each atom has the potential of 10ua, and there are 237 atoms/row this leaves $2.37\text{ma/row} * 10 \text{ rows} = 23.7\text{ma}$ max current per power pole

2. I counted the power poles on euterpe:: 483 (a little less than 47 of these should possibly be excluded.. the point is the number is better than 10% accurate)
since there are two flavors, $483/2=241$ for each flavor power supply lead (vdd/vss)
The total nom power for euterpe is 55watts, 21 watts come from custom (non sofa stuff) this leave 34 watts for the sofa, reduced to 1/5 pwr this goes to $34/5=6.8\text{watts}$, $6.8\text{watts}/3.3\text{v}=2.06\text{amps}$, $2,060\text{ma}/241=8.54\text{ma}$.

are we really only using $8.54/23.7 = 0.36$ of the available power ?? in the xlu it was close to 0.8

I would like response to my numbers. Am i missing something?? if the numbers are ok then we need to respond to probe technology with..

current per pad = 8.5ma average 23.7ma max

I think it makes more sense for me to feed andrew the numbers and have only one point of communication between ourselves and probe technology.

Subject: bring-up meeting of November 2

Next meeting: Nov. 9 at 10:00; we'll review the Euterpe
Bring-up section of the schedule at this meeting.

Johnny Mudge joined us for the first hour to discuss component testing of Calliope and Euterpe. Ultimately, Johnny's group will produce packaged chips with a data sheet that will be written as testing proceeds. Johnny's group will also produce information about each chip they test - namely, what works and what doesn't. The test vectors will touch a large percentage of the functionality of Calliope and Euterpe. There is not yet a formal plan for these tests. Someone will either need to convert the verification group's dvts or write tests from scratch that generate vectors for the HP tester. Mark Warren is working on test vectors for Calliope, and will be looking at them for Euterpe.

Johnny will provide us with a plan for the test vectors. (This is to be worked out between Mark's group and Lisa's group.) Johnny will also produce a plan for tracking individual components.

Action item: determine whether we should interface Johnny's daughter card to our boards, or whether we can remove and resolder tab devices to the boards. (Wayne)

Action item: develop plan for tracking individual components in verification: is the logbook sufficient? do we need a database system? how does it relate to Johnny's tracking plan? (Wayne, Derek)

Review of old action items:

> Define parallel interface (Wayne, Gmo, and Sandeep)
Essentially done; Wayne will incorporate the description into the CBI document by Friday.

> Implement parallel port device drivers for sun and
> sgi (Sandeep, Derek)
This will be postponed until after the remote gdb work, closer to when real hardware will be available.

> Define the boot state for standalone tests (Jeff, Gmo)
Done. New action item: write boot code (Gmo)

> Write up a plan for virtual devices and their

- > interaction with gdb (Gmo)

In progress.

- > Build scripting/UI capabilities above gdb for
- > regression tests (Derek)

No progress.

- > Create a separate tool for loading FlashROM
- > (Unassigned)

No progress [manufacturing issue].

- > Implement remote gdb with the software simulator
- > (Sandeep)

In progress. Current due date is November 9, although Sandeep discovered more work than he expected.

- > Find out who is driving the characterization testing
- > of components, especially for Euterpe. (Loretta)

Done. See summary at the beginning of this message.

- > Develop set of milestones and schedule for bring-up
- > (Wayne, Derek, Loretta)

Done. New action item: Get durations for events on the schedule (Derek)

- > Add the Verification group's test control document
- > to the bring-up plan.

No progress.

- > Write a summary of the hardware bring-up process
- > to cross-check with Wayne's schedule (Jeff)

Jeff obtained useful information from today's meeting, but needs some time with Wayne before he can write the summary.

- > Identify our bring-up tools and make sure we
- > have plans for how we will debug them. (Derek, et al)

In progress.

- > Develop plan for testing real-time software before
- > the analog parts of calliope work. (Gregg)

I talked with Gregg after the meeting. The most practical plan is to use Pandora when it is available to load data into Hestia memory. Other options seem like more work than they are worth.

- > Verify SN3. (Wayne)

Done.

Action items from the CBI interface meeting:

- > Find out if it is a requirement for SD to *remain* low
- > for a reset (Wayne)

Done.

- > Determine which pins can be software controlled on each
- > of the parallel ports we are planning to support
- > (Derek)

No progress.

- > Ask Craig if an abort invalidates the byte in transit
- > or the entire packet. (Wayne)

No progress.

- > Understand how interrupts are generated by the parallel
- > ports under consideration. (Sandeep, Derek)

No progress.

New action items:

Create performance test plans (Jeff, Loretta)

Add Unix-like tests to software acceptance tests. (Loretta)

Hi Tim,

I was looking in :

/n/auspex/s41/euterpe-proteus/proteus

Apparently that is different from :

/n/auspex/s41/euterpe-snapshot/euterpe/proteus

I though that Lisa had said that these two were linked together and were the same thing

When I do an ls in /n/auspex/s41/euterpe-proteus/proteus/verilog

I get :

BOM	Makefile	dclib	eclib	mllib	xlib	zclib
BOM.BAK	cerbmaster	diff.h	exlib	src	zblib	zeblib
CVS	clib	dxlib	libsrc	wrappers	zblibsrc	zxlib

NO elib or delib ...

Geert

The total nom power for euterpe is 55watts, 21 watts come from custom (non sofa stuff)
this leave 34 watts for the sofa, reduced to 1/5 pwr this goes to 34/5=6.8watts,
6.8watts/3.3v=2.06amps, 2,060ma/241=8.54ma.

are we really only using $8.54/23.7 = 0.36$ of the available power ?? in the xlu it was close to 0.8

My guess would have been 0.6. If geert has a top level topt log file we can find the exact number.

I would like response to my numbers. Am i missing something?? if the numbers are ok then we need to respond to probe technology with..

current per pad = 8.5ma average 23.7ma max

I think it makes more sense for me to feed andrew the numbers and have only one point of communication between ourselves and probe technology.

If you already know the number is 0.8 in the XLU, then clearly we have local areas where we may be well above the average. Should we be making the worst case assumption?

Hi Tim,

I was looking in :

/n/auspex/s41/euterpe-proteus/proteus

Apparently that is different from :

/n/auspex/s41/euterpe-snapshot/euterpe/proteus

I though that Lisa had said that these two were linked together and were the same thing

When I do an ls in /n/auspex/s41/euterpe-proteus/proteus/verilog

I get :

BOM	Makefile	dclib	eclib	mlib
xlib	zclib			
BOM.BAK	cerbmaster	diff.h	exlib	src
zblib	zeblib			
CVS	clib	dxlib	libsrc	
wrappers	zblibsrc	zxlib		

NO elib or delib ...

Geert

----- End of forwarded message -----

Its a long story

I was building an proteus from scratch in /n/auspex/s41/euterpe-proteus/proteus but brianl needed to rerun in /u/chip so we stopped the s41 build and instead took a tar image of /u/chip so as not to hold up the snapshot
- remember we discussed it. Tom put this on /n/auspex/s23/euterpe-proteus-cp.

Then I needed some space to do the euterpe build so I made a euterpe in the euterpe-

proteus and asked tom to rename euterpe-proteus to euterpe-snapshot.
However since he didn't want to mess up work in progress he just symbolically linked it to euterpe-snaphot. The proteus used by the euterpe build does NOT point at ../proteus since that is not the snapshot proteus but to /n/auspex/s23....
I am still waiting for the go ahead from brian to restart the build from scratch proteus build which will probably be done somewhere else so as not to fill up /s41.

I will remove the dinosaur proteus in /s41.

Would larger partitions (> 2gb) be a help here? Tim- have the sysadms gotten a definitive
answer on this one? It seems to me that once we have 9Gb disks it will be terribly
inefficient to be tied to 2Gb partitions.

The only problem is if the O/S insists on counting bytes, then $2^{31} = 2\text{Gb}$ is a limit. However, partitions are block-oriented things (where a block is usually 1k or 4k bytes) so, in theory, the O/S should be able to address at least 2Terabytes without a problem.

Well, the bsd file system supports 512B fragments, so I think that's the basic unit, but even so, it gives another 9 bits of address.

Which should hold us at least until Euterpe II!

Yes. Actually, I think there used to be an issue with backup with big partitions. I'm not sure if that was because of 2GB tape capacity or because they used to use mirrored partitions, but now we use 5GB tapes so that limit should have gone up. As far as I know dump handles multivolume dumps OK anyway.

Release euterpe/verilog/bsrc/lt BOM 67.0 initiated by woody completed @ Wed Nov 2 21:29:25
PST 1994 with exit status 0.. chip

From: Jay Tomlinson [woody@luckboy]
Sent: Thursday, November 03, 1994 11:28 AM
To: 'euterpe@luckboy'
Subject: IMMINENT Decision: instruction cache tag bit change

The current micro-arch doc defines the bits of the instruction cache tag as follows:

bit	meaning
7	Caching control, exception 3 if set
6	Detail access, exception 2 if set
5..2	ignored by hardware
1..0	Execution access, causes exception 1 if > privilege level

I propose changing the location of the Execution Access field to allow the hardware to use bit 0 as a valid bit (bit 0 of the data cache tag is the defined as the dirty-bit). This change would speed up the I-cache miss processing by allowing the hardware to invalidate the tag entry without having to write the entire entry. This change will also simplify the euterpe hardware. The tag array has a write-enable for this bit.

My proposal for the new bit definitions is:

bit	meaning
7	Caching control, exception 3 if set
6	Detail access, exception 2 if set
5..4	ignored by hardware
3..2	Execution access, causes exception 1 if > privilege level
1	ignored by hardware
0	valid

This change will become final at 11:59PM Monday, Nov 7, 1994.
Objections should be sent out immediately and can be reviewed Friday/Monday.

Chopped pin one in parts:
p110_00004
p110_00005
p110_00006
p110_00006
p110_00008
p110_00013
p110_00017
p110_00019
p110_00021
p110_00028
p180_00004
p370_00004

Used my material list and chopped all pin ones that were in a semetrical footprint.

Subject: Re: == gmake -k in /p/soft/stb/terp-src/stb failed, see /p/soft/stb/terp-src/stb-log ==

It occurred to me last night that I might have forgotten to check this file in.

That's a good idea about allocating a jmp_buf on the stack and pointing to it from one of the structures.

I prefer moving the error_label from mpeg_decoder to mpeg_unpacker.

The primary purpose of the special case in the default error handler is for documentation. I don't expect that the default error handler will actually be used for production, it's primary purpose is as a debug aide.

Subject: IMMINENT DECISION : change in pad-assignment

Hi,

Two decision were made related to power distribution on Calliope and Euterpe

1. Calliope

We will connect the SENSE pad to the sealring. Currently, it is hooked up to the M3 layer (VDDE) on the space transformer, but the corresponding pad on the die is not hooked up to VDDE. We will now connect the die-pad to the seal-ring (also VDDE) in order to create another VDDE pad and reduce IR drops during test.

2. Euterpe

We will change the power-pad assignment : currently we have VDDE on top and bottom and VSS on the sides.

At the top and bottom, every other VDDE pad will be changed to a VSS pad. We need the VSS connections to provide power to the DRAM drivers.

On the sides, spare pads used to be assigned to VSS. Now, every other pad will be VDDE. The reason is the same as for Calliope : reduce IR drop during test.

None of these changes should affect the Tab-frame or board design. All VSS pads are always changed to VDDE pads on the space-transformer.

```

After looking the stuff over further, I'm inclined to agree with you that the PSI decode/error stuff is best handled in mpeg_decoder.

This also simplifies the DEMUX code.

Given that the PSI code sets up the error_label entry in mpeg_demux_t, it seems to me that there's no longer anything PSI specific about it: the error routine should simply longjmp through error_label on a hard-error when it's non-zero, but this code can now be moved into the mpeg_decode version of the error handler. The default error case in the mpeg_decode error handler should then do the appropriate function and call the unpacker's error code handler for more generic unpacker type things.

I still maintain that any real code should provide it's own error handler, leaving the the default for stand-alone test use.

Update of /p/cvsroot/gnu-tools/sim/terp
In directory calliope:/N/auspex/root/s6/lisa/src/gnu-tools/sim/terp

Modified Files:

memory.c

Log Message:

- Put the real length of the tlb's in their access structures.
- Translation macros/routines (e.g. lv_to_gv) now need the access_type.
- Pass the access type to do_exception().

Sorry, I just got back from lunch and two meetings. Are you still having trouble? I ran it with no problems, so if it is still crashing on you, please send me the exact command line and path so I can try it.

Geert

So just to make sure I understand - On Calliope at WAFER SORT, the sense pad #52 that is currently a "no connect" needs to be connected to the Vdde power plane?

Andrew

From: Geert Rosseel on Thu, Nov 3, 1994 10:25 AM
Subject: IMMINENT DECISION : change in pad-assignment
To: hardheads

Hi,

Two decision were made related to power distribution on Calliope and Euterpe

1. Calliope

We will connect the SENSE pad to the sealring. Currently, it is hooked up to the M3 layer (VDDE) on the space transformer, but the corresponding pad on the die is not hooked up to VDDE. We will now connect the die-pad to the seal-ring (also VDDE) in order to create another VDDE pad and reduce IR drops during test.

2. Euterpe

We will change the power-pad assignment : currently we have VDDE on top and bottom and VSS on the sides.

At the top and bottom, every other VDDE pad will be changed to a VSS pad. We need the VSS connections to provide power to the DRAM drivers.

On the sides, spare pads used to be assigned to VSS. Now, every other pad will be VDDE. The reason is the same as for Calliope : reduce IR drop during test.

None of these changes should affect the Tab-frame or board design. All VSS pads are always changed to VDDE pads on the space-transformer.

Subject: MicroModule

Hi,

MicroModule will be here on Monday morning at 9:30 a.m.. They offer "silocon-on-substrate" packages (kind of a space-transformer without the airbridge). We will probable need something like this to get the power into our foundry Euterpe.

If you want to come to this meeting, please do so.

Update of /p/cvsroot/gnu-tools/sim/terp
In directory calliope:/N/auspex/root/s6/lisa/src/gnu-tools/sim/terp

Modified Files:
memory.h memory.c

Log Message:

Changed the nb_buf field from an array of bytes into a "real" hexlet, so that it has better alignment.

From: lisa
Sent: Thursday, November 03, 1994 8:34 PM
To: 'gmo'
Subject: terp coredump on sun

When I removed a field from the nb-access structure, the position change of the nb_buf array (within the structure) ran into alignment problems. (The bus error was from an unaligned access.) I just checked-in a fix (memory.h, memory.c).

5 1692	proteus/gardswarts/protowart	thoas(25218)	wampler	wait

Okay. I was hoping to get a snapshot done so that Dave could start up a DRC and Kurt could start up a fracture of the euterpe baseplate. Two spotted and error in pl_euh which Kurt and Rich have patched. I believe that fix has been checked in and released but has not yet shown up in /u/chip. I _think_ the stuff in the chipq should handle that. Do I have that right?

At any rate, I don't think your release should affect being able to create a snapshot. I think the DRC/fracture should be done from the snapshot area. I just wanted to let people know that Euterpe baseplate status.

I think after the gardswart builds, we need an update-chip in proteus/ged/pl to get the verilog representation regenerated from the schematic (which includes the body that came from the gards netlist that came from the verilog in proteus/verilog/src/pl).

Whew! I wish this linkage was automatic.

Okay. Good.

The chipq is empty, as well.

Let's proceed with the snap shot and then launch DRC and fracture of the baseplate from there.

I ran the update-chip to get the verilog abstraction rebuilt.

Last night I found some inconsistencies in the proteus snapshot under the snapshot euterpe (missing stuff in verilog/libsrc).

I think we need to pull the latest BOM into that version of proteus and do the incremental build to be sure we have everything current.

Comments?

Wayne wrote:

- > Ask Craig if an abort invalidates the byte in transit
- > or the entire packet. (Wayne)

Craig, I was given an action item to verify a question with you. When an Abort is issued, is the byte only invalidated, or is the entire packet be invalidated. In addition, is there a specific time response for the sending device to respond to the Abort (retransmit) before another device grabs the bus, or is it first come first serve here?

Thanks,

Wayne

Craig responds:

An abort, in which the SD line is driven low for 12-22 cycles, causes the entire transaction to be aborted. This is more extensive than the choices you gave me (byte in transit or the entire packet); the entire transaction is aborted, no matter whether the current packet is a request or response. [see page TSA 14-Apr-94 page 294.]

After an abort, the next transaction may begin immediately upon seeing SD high for one cycle (which ends the abort) [Page 294]. A device which has lost the arbitration of a collision, or has suffered the occurrence of a transaction abort, may retry the transmission immediately [Page 296]. All other devices must wait one additional cycle before transmitting, ensuring that all devices which have collided perform their operations before another set of devices arbitrate again [Page 296]. It may be noted that other devices which were arbitrating for access at the same time as the device which initiated the aborted transaction get the opportunity to respond at the same time as the previous initiator; provided that the contents of the requests are the same as the previous transaction, the result of the arbitration on the retransmitted transaction should be the same as the previous, aborted, transaction.

The above mechanism might appear to ensure that an transaction initiator, one having begin a transaction can simply assume that it need not worry about another transaction grabbing the bus away. However, this is not the case. Firstly, a transaction abort may occur before arbitration has been completed on the local Cerberus bus, and the initiator may lose arbitration on the retransmission. The initiator must be prepared to accept the loss of arbitration, even when the loss implies that it must respond as a target of the transaction. Secondly, gateways and repeaters may need to apparently override the local fairness mechanism to ensure global fairness or to avoid system deadlock, and in such cases, may begin a retransmission immediately upon the end of an abort even though it wasn't among the set of initiators of the previous transaction. [see page 307]

Also, a device which requires a delay after an aborted transaction may force the delay bit after the first byte of the immediately

following transaction, and may cause the first byte to be re-transmitted by aborting the following transaction after requesting a suitable delay [page 297].

Regards,
Craig

```

Within the cp block that is true, but when the cp is included in the top level, topt will allow changes to happen because the init_inst in the power.tab.local is not propogated to the top level.

when power optimizing a block, the init_inst and inst directives act identical, but init_inst is not propogated to the top level power.tab.local, while inst is.

Does this help?

Subject: euterpe drc's

I've started the euterpe drc runs:

upper drc's on medusa
lower drc's on cyclops and trex

I have both processors busy on medusa, so if that machine could be treated as drc only, ie; no chip related functions, the drc's will finish much faster.
If cyclops could be limited to only one chip related function so as not to slow down the dracula job, that would also help a lot.

Some conversion stats:

upper drc's: 90% of the checks were converted to vlsimm
lower drc's: 69% of the checks were converted to vslimm

If we see a 2x improvement (which we should), then the uppers should finish in about 1.5-2 days and the first phase of the lower should finish in about 3.5-4 days, hopefully less.

Is it possible to start up an lvs as well?

Thanks,
Dave

Subject: IMMINENT DECISION: PCI driver

IMMINENT DECISION:

We have decided to use the IDT FCT buffer P.N. IDT74FCT164245T as the PCI driver. We will then use the current euterpe I/O buffer as the mnemo I/O buffer even for the PCI bus. The PCI bus will be buffered by the IDT74FCT164245T.

Background info:

The PCI bus according to the PCI electrical specification rev 2.0 is a very hostile environment. The 3 most notorious specs for 5V signalling are listed below:

- | | PCI Rev 2.0 | IDT spec |
|-----------------------------|--------------|-------------|
| o AC Ioh (at Vout = 3.1V) = | -142 mA | -180 mA |
| o AC Iol (at Vout = 0.71) = | 206 mA | 200 mA |
| o Overshoot tolerance = | 11V for 11nS | 7V for 20nS |

The IDT part is the only part that comes close to meeting all the nasty PCI specs.

It will be a major undertaking to meet the AC current specs and the overshoot spec if we are to design a PCI compliant buffer on chip, not to mention the large di/dt noise we have to content with. A logical solution is to use an external buffer to do the 3 to 5 Volt level translation and at the same time buffer mnemo from the hostile PCI environment.

Date for Final DECISION is set at Wednesday, Nov 9, 1994 at 8:00am if there is no objection to this proposal.

Note from the dates above that the actual copying worked. Is this perchance another example of the infamous `cp -p'? You've all heard me belly-ache about this before -- well, here's yet another reason not to do this unless it's strictly necessary: when you do a `cp -p' to an existing file, the actual copying succeeds if you have write permission on the file, but then the backdating fails unless you really are the owner of the file.

Solutions:

don't use cp -p

do an rm -f of the old file before copying

The release of pl_euh & pl_euh_sofa completed, and the fixed layouts have propagated to /u/chip/proteus/compass/layouts. I also just completed a ".0" releasebom in proteus/gardswarts -- only the pl_euh gardswart rebuilt itself -- the other two were up-to-date. Everything looks stable in wart land.

Okay. Good.

The chipq is empty, as well.

Let's proceed with the snap shot and then launch DRC and fracture of the baseplate from there.

I ran the update-chip to get the verilog abstraction rebuilt.

Last night I found some inconsistencies in the proteus snapshot under the snapshot euterpe (missing stuff in verilog/libsrc).

I think we need to pull the latest BOM into that version of proteus and do the incremental build to be sure we have everything current.

OK, as per later discussions, I did a getbom in euterpe-snapshot/euterpe/proteus/compass. This is now complete. Is there a reason not to start up the getbom in euterpe-snapshot/euterpe/proteus now?

No reason. However, given I've been offline so long, did this get done. A cvs status right now says it's out of date again:

File: BOM Status: Needs Checkout

A cvs log on proteus/BOM indicates that all changes since 5.521 have
been updates to the "mb" block, with the exception of the single "-"
that

I just added to the clockbias Makefile.rules. If "mb" isn't used in
Euterpe, (is it a Mnemo block?) then there should be no need for another
getbom, I think.

mb is indeed mnemo only.

I just tried to fire off a make of the snapshot proteus following the getbom. It died immediately because of a permission problem trying to update ged/mb/mb.lib. I restarted it as chip and it has got past there. Is everything in that tree owned by chip? We have the euterpe snapshot set up to be group writeable by cad so people can work there without having to su to chip. Since we don't expect too frequent changes to proteus it should be no problem having to su, so long as everything is consistently owned by chip.

source line number 30
/bin/nawk: can't open mlmuxen7dh12s.mt0
source line number 17
/bin/nawk: can't open mlmuxen7dh12s.mt0
source line number 17
/bin/nawk: can't open mlmuxen7dh12s.mt0
source line number 17
mv: mlmuxen7dh12s.mt0: Cannot access: No such file or directory ../tools/simulate-time
error: mlmuxen7dh12s.scr failed
../tools/simulate-time: moving mlmuxen7dh12s.tim to mlmuxen7dh12s.tim.bad
deal: end mercury stderr (child 12089)
```

Now, none of these seem to have stopped the make. What's going wrong here? Is this the reason we always seem to have a few bad timing numbers lying around?

The full log is to be found in
/n/auspex/s41/euterpe-snapshot/euterpe/proteus/makerrs

Subject: proteus snapshot stale

Where are we getting the snapshot proteus these days ?
We're still having problem with the gtlb .

The one that euterpe snapshot references looks stale :

```
-rwxr-xr-x 1 chip      3560421 Nov  4 10:36  
/n/auspex/s23/euterpe-proteus-cp/proteus/compass/layouts/gtlb.ly  
-rw-rw-r-- 1 chip      139543 Sep 23 21:12  
/n/auspex/s23/euterpe-proteus-cp/proteus/compass/dcell/gtlb.ly  
  
-rwxr-xr-x 1 chip      3560421 Oct 31 15:31  
/u/chip/proteus/compass/layouts/gtlb.ly  
-rw-r--r-- 1 chip      139944 Nov  3 12:42  
/u/chip/proteus/compass/dcell/gtlb.ly
```

Either the rebuild in the snapshot proteus did not take , or we did not copy all the files we need .

I'm out for the morning . I'll check back in the afternoon .

Hi Tim,

I am not sure what needs to be done at the toplevel in the snapshot.
Please go ahead and update whatever you think needs it.

P.S. : Did mouss corner you already with his revived version of
the XDB for euterpe II ? It is interesting for the datapath
implementation, but control will be though.

Subject: Help on euterpe ?

Hi Kurt,

Do you have any free cycles to help on top-level Euterpe routing ?
Currently, a lot of people are helping out on sub-block placement & routing and I am working on the toplevel place and route. I could use help there and I'd like to split the task in two where one person works mostly on placement and another takes on the routing task.

Since you are much more familiar with the routing strategies and different parameters, I thought I could work further on the placement and you could help on routing.

Thank's

Geert

Yes, I can help. At the moment I'm trying to fix an obstruction
abstraction inaccuracy that Brian has exposed, but the rest of my "to do"
list can timeshare with routing work. Of course, if I have problems
with a route, it may be necessary to adjust the placement sometimes...

When you have the time, give me a few more of the details and I'll get
started.

The first make just completed (exit 1). This was expected because of the disk full and license problems. Brianl has cleaned up the bogus timing files that wer created and I have restarted the make.
Hopefully only about 10% of them should need running on this pass.

I'll page if I get it to complete successfully.

Subject: euterpe/verilog/bsrc/pimlib.pl

Hi Tim,

euterpe/verilog/bsrc/pimlib.pl contains this :

```
/^s*(\S+)\s+(\S+)\s+(\S+)\s*(.*)/    && do {  
    printf ("%s%s\t %g\t %g\t %s\n",  
        $inst, $1, $2 + $baserow, $3 + $basecol,  
        (($4 && (substr($4,0,1) ne "#"))? $inst.$4 : $4));
```

in the shiftpim_v subroutine

This does not work because of the \$inst.\$4 : \$4

Usually, in the pim files that I see, \$4 is something like <1934 and is an alignment mark for pimpif. Adding the \$inst does not work .

Do you remember why that was added. Are there cases where this is necessary but I haven't seen yet.

I didn't work on this file, but I think I understand what's happened. the alignment marks of the type that Geert is seeing "<1934" are fairly new. They are really "bounds" marks which constrain a cell placement. At any rate, I will attempt to patch pimlib.pl

Mark Hofmann wrote (on Sat Nov 5):

Tim B. Robinson writes:

Could be, but if he actually removed 60 odd files, those ones would have to run since there would be no timestamp. Nothing re-ran.

Hmm. Okay, I'm not sure what's going on.

Do you have any idea how long the leafmold run is?

I think a full run takes a good fraction of a day (depending on how many guards licenses are available). Hopefully, though, only the 25-or-so failing cells will be attempted which ought go pretty quick.

No, ot's worse than that. For reasons brian could not fully explain, the timing characterixation was run for all lobes. Order 60 failed and he said he removed the results. Now it appears that it is remaking all the leafcell layouts:

tbr@gamorra /n/auspex/s41/euterpe-snapshot/euterpe/proteus/leafgen/leafmold 417 % wc -l *.list.*

```
309 tmp.list.hepatu
310 tmp.list.marathon
310 tmp.list.merope
310 tmp.list.psyche
309 tmp.list.thalia
1548 total
```

There is also another problem that brian was going to look at. Since the leafgen Makefile does not actually update the master timing file when the run completes, the top level Makefile will charge on leaving the timing cata to be copied over by hand. I suggested he put something in the top level makefile to do that copy. That would not affect a release at the leafgen level whcih would stioll need manual intervention to change the timing file.

Thinking about it some more, the correct solution would be to have another targer in the leafgen Makefile which makes the tmp file and then copies it over. The top level proteus Makefile would ask for that targer, but the leafgen .checkoutrc would still ask for the target that does not do the copy.

|trouble with proteus snapshot update 338 4152. tbr

I've just scanned a couple email messages, and am cleaning the junk out of merope:/usr/tmp. What else should I be doing?

Perhaps you could do some poking in the snapshot to assess the damage. Here's the history. I started up a top level Make in the s23/proteus. For whatever reason, it decided to re-run all the lobe timing. There were 2 problems, merope:/tmp full which according to brianl causes jobs to die, but with spice returning a success error code. Second, there was a problem with mercury (I think) not being able to get a spice license for some reason. That caused another bunch of things to die, but without creating results (according to brian). So, brian said he was removing around 60 bogus outputs files from the jobs that went to merope, and he then took the 2 bad machines off the deal list. The run died when deal finally finished with exit1.

I then restarted the Make, expecting it to re-run the missing cases, but instead it went on to make the leafcell layouts and as far as I can see did not try to re-run any timing. Of course then I ran into the merope problem with the leafinold runs dying there, so we now possibly have another bunch of bad stuff.

Since the timing did not re-run I'm worried brian removed files in the wrong place. If you could take a look through the makerrs in /n/auspex/s41/euterpe-snapshot/euterpe/proteus you will see the history. (The current run is being appended.) Please see if you can tell if the results of the dying jobs did indeed get removed, and if so, why the new run did not remake them.

One possibly relevant fact is that between the runs I discovered we did not have the latest top level Makefile in the proteus snapshot so I updated and releasebommed that file. It came up 3 revisions. It's just possible the reason the timing has not re-run is because of some ordering change between those versions.

Let me know what you find.

Thanks

Tim

Patricia Mayer wrote (on Thu Nov 3):

Another part issue that Philip mentioned was a fiducial mark for Caliope and Euterpe. ??

I think this was worked out for the TAB test board and as far as I know we said long ago we would go with the same. Maybe it never made it into the prt. I assume glen has a version in PCAD somewhere.

|page from tbr to tom:
|trouble with proteus snapshot update 338 4152. tbr

|I've just scanned a couple email messages, and am cleaning the junk out
|of merope:/usr/tmp. What else should I be doing?

|Perhaps you could do some poking in the snapshot to assess the damage.
|Here's the history. I started up a top level Make in the s23/proteus.
|For whatever reason, it decided to re-run all the lobe timing.
|There were 2 problems, merope:/tmp full which according to brian
|causes jobs to die, but with spice returning a success error code.
|Second, there was a problem with mercury (I think) not being able to
|get a spice license for some reason. That caused another bunch of
|things to die, but without creating results (according to brian).
|So, brian said he was removeing around 60 bogus outputs files from the
|jobs that went to merope, and he then took the 2 bad machines off the
|deal list. The run died when deal finally finished with exit1.

|I then restarted the Make, expecting it to re-run the missing cases,
|but instead it went on to make the leafcell layouts and as far as I
|can see did not try to re-run any timing. Of course then I ran into
|the merope problem with the leafmold runs dying there, so we now
|possibly have another bunch of bad stuff.

|Since the timing did not re-run I'm worried brian removed files in the
|wrong place. If you could take a look through the makerrs in
|/n/auspex/s41/euterpe-snapshot/euterpe/proteus you will see the
|history. (The current run is being appended.) Please see if you can
|tell if the results of the dying jobs did indeed get removed, and if
|so, why the new run did not remake them.

|One possibly relevant fact is that between the runs I discovered we
|did not have the latest top level Makefile in the proteus snapshot
|so I updated and releasebommed that file. It came up 3 revisions.
|It's just possible the reason the timing has not re-run is because of
|some ordering change between those versions.

|Let me know what you find.

OK, the change in toplevel Makefile is important. The (version 1.21)
Makefile said

`$(MAKE) -C leafgen everything`

while the new (version 1.24) one says

`$(MAKE) -C leafgen all`

I think there's some funky history involved in this, but anyway at the present the 'all' target in leafgen/Makefile does more than the 'everything' target. Specifically, it runs the make in the leafmold subdirectory before doing the timing stuff. So it's not a matter that the timing stuff didn't get rerun; it just hasn't happened yet. I don't think I understand what happens in the leafgen Makefile well enough to figure out whether brianl did the proper surgery there or not.

BTW, one reason that merope's temp area was full (both /tmp and /usr/tmp are on the /usr disk) is a problem in leafmold. For the most part, it's pretty careful to clean up after itself if it fails, but I missed a case: if it failed because the first cp of files into its temporary directory (/usr/tmp/leafmold.<cellname>) failed, it just exited. It appears that, when I did a big leafmold test run on thursday, the disk was full, and then whatever else had filled it slowly freed up space. Unfortunately, each successive leafmold process filled what was left, then died uncleanly. I have a fixed version in my local area, which I'll check in after some testing.

I think for the lower layer euterpe baseplate , we just need to run proteus/dcell and
proteus/gards .checkoutrc to get the new gtlb footprint .
The new timing number may change how some of the gardswart blocks are built so there's a
bit a exposure there . If my run completes before the gardswart rebuild , my netlist
could be out of syn wrt the layout .
But the lower layers for the gardswarts should not change .

The output from euterpe/verilog/bsrc/nb/.checkoutrc is 336k, so it is not included in this mail message. Instead, check the file

/n/tmp/chiplog/hopper.cyclops.16571.euterpe-verilog-bsrc-nb

(which is accessible from all machines). This file will disappear in about 5 days.

By the way, the exit status returned by .checkoutrc was 1.

You'll need to run them in sequence : dcell , then gards .

Yes. Dcell is running now, but I see:

```
ERROR -- can't find cell `XBLDH4S' (boo file `../compass/vlsi.boo-all') ERROR -- can't
find cell `XBORL2DH4S' (boo file `../compass/vlsi.boo-all') ERROR -- can't find cell
`XBORL2DF4S' (boo file `../compass/vlsi.boo-all') ERROR -- can't find cell `XBORL3DF4S'
(boo file `../compass/vlsi.boo-all') ERROR -- can't find cell `XBLDF4S' (boo file
`../compass/vlsi.boo-all')
```

It seems to be continuing though.

I though Rich was still looking at possibly implementing those using the lms hardware.
Otherwise I guess I'll have to change terp to be bug-compatible with the hardware
(Bug because if the instruction does not do what it is supposed to it just shouldn't
be there, but yea I know, checking for it to produce the exceptions is more atomes, right?).

Gmo.

Wayne wrote:

- > Ask Craig if an abort invalidates the byte in transit
- > or the entire packet. (Wayne)

Craig, I was given an action item to verify a question with you. When an Abort is issued, is the byte only invalidated, or is the entire packet be invalidated. In addition, is there a specific time response for the sending device to respond to the Abort (retransmit) before another device grabs the bus, or is it first come first serve here?

Thanks,

Wayne

Craig responds:

An abort, in which the SD line is driven low for 12-22 cycles, causes the entire transaction to be aborted. This is more extensive than the choices you gave me (byte in transit or the entire packet); the entire transaction is aborted, no matter whether the current packet is a request or response. [see page TSA 14-Apr-94 page 294.]

After an abort, the next transaction may begin immediately upon seeing SD high for one cycle (which ends the abort) [Page 294]. A device which has lost the arbitration of a collision, or has suffered the occurrence of a transaction abort, may retry the transmission immediately [Page 296]. All other devices must wait one additional cycle before transmitting, ensuring that all devices which have collided perform their operations before

another set of devices arbitrate again [Page 296]. It may be noted that other devices which were arbitrating for access at the same time as the device which initiated the aborted transaction get the opportunity to respond at the same time as the previous initiator; provided that the contents of the requests are the same as the previous transaction, the result of the arbitration on the retransmitted transaction should be the same as the previous, aborted, transaction.

The above mechanism might appear to ensure that an transaction initiator, one having begin a transaction can simply assume that it need not worry about another transaction grabbing the bus away. However, this is not the case. Firstly, a transaction abort may occur before arbitration has been completed on the local Cerberus bus, and the initiator may lose arbitration on the retransmission. The initiator must be prepared to accept the loss of arbitration, even when the loss implies that it must respond as a target of the transaction. Secondly, gateways and repeaters may need to apparently override the local fairness mechanism to ensure global fairness or to avoid system deadlock, and in such cases, may begin a retransmission immediately upon the end of an abort even though it wasn't among the set of initiators of the previous transaction. [see page 307]

Also, a device which requires a delay after an aborted transaction may force the delay bit after the first byte of the immediately following transaction, and may cause the first byte to be re-transmitted by aborting the following transaction after requesting a suitable delay [page 297].

Regards,
Craig

Wampler replies:

...and in the gardswarts Makefile, and in virtually every other script and Makefile I've produced, the preservation of the date/time stamp and protection mode during copy is **exactly** the behavior I want.

Well, it ain't the behavior I want. I'd rather have gmake know the correct time when a file changed, so it can do its job. Have we already forgotten the last time this issue came up? The details have happily faded from my memory, but it seems to me we spent at least a day chasing some error that we knew we had fixed, but gmake didn't know it because of a `cp -p'.

As I mentioned before, you've all heard me bellyache about this in the past. To reiterate: propagating the timestamp of the original file is absolutely, unquestionably, incontrovertably wrong for any case where the timestamp of the result is used by gmake to determine what it needs to do. It is necessary to have the timestamp reflect the time of change of the particular copy of the file that is being used. Using any other timestamp is asking for trouble. Besides, who the heck cares what the timestamp of the source information was? Do we set the timestamp of each checked out copy of a file to the date of the checkin? Of course not!

<FLAME ON>

I contend that cp's failure to deal properly with the case where the file is being written under group permission is a UNIX bug.

Call it a bug if you like, but it's a pretty inevitable result of the permissions system. If you don't own the file, you can't screw with the inode. It would be a bigger mistake for `cp -p` to try to force ownership of the file by removing the old and creating a new one, since then it will fail if you don't have write permission on the directory.

I tested the behavior of "cp -p" under SunOS, IRIX, and HP/UX. SunOS permits the contents of the file to be copied, but croaks when it tries to set permission/timestamp. Under IRIX it copies the contents, propagates the date, but does not update the protection mode, yet exits with 0 status. Better, but still not correct.

No, that's worse. It failed to do what you explicitly told it was required, yet it gave no error indication. That's what I call a bug.

BTW, in my test, it didn't propagate the old date (which it couldn't have done, since I didn't own the file); it simply acted like a regular cp.

Under HP/UX, it fails altogether -- it doesn't even copy the contents. In fact, a regular "cp" without the "-p" switch fails too. When I add "o+w" to my test file, HP/UX copies and sets the date, but fails on the mode change. Really brain dead implementation.

<FLAME OFF>

I believe adding a "-" in front of the line above which reads:

```
cp -p knob*.ly clockbias.ly cgclockbias.ly $(BASE)
```

will alleviate the immediate problem. I have made and releasebom'ed this change.

ACK!!!

So we'll just ignore whether or not the copy succeeds?!?!?

The correct fix is to get rid of the bloody -p option, and quit trying to lie to people (and, worse, programs) about when a file changed.

Look, I apologize for the strident tone of this message, but this is not an unimportant issue, and I had thought we had already hashed it out. I for one am not anxious to be called in a third time to help diagnose some screwball problem caused by `cp -p`. I'm going to compile a list of all files in the repository that contain the string `cp -p`, and I strongly recommend we change every one of them, unless there is some specific reason why a regular `cp` can't be used instead (I can't imagine what such a reason would be, but I'll accept the possibility that it might exist).

```

Not particularly. That rule seems to be set up always to run. This
kinda makes sense, since really it should run any time a new schematic
is added to (or deleted from) any subdirectory. Getting the
dependencies right would be harder than just rebuilding the xx/xx.lib
files.

Tom Laidig wrote (on Sat Nov 5):

Tim B. Robinson writes:

Looks like there is more trouble. I think I started up the re-run as me rather than chip and there are probably permissions problems all over the place. Please look at the log files in the leafmold directory and let me know if I should kill it and restart as chip.

I don't see any evidence that problems were caused by that, but a bunch of stuff crapped out because of tmp disk messes (on merope, and, to a lesser extent, on psyche). I suggest killing and restarting because of this, and then you might as well restart as chip. Also, I'll start a find looking for files owned by you, which we probably want to delete before restarting the run as chip.

OK. It's dead. Let me know when to restart.

It took a while for the find to complete. Here's the list of files you own:

```
./ged/master.local
./ged/startup.concept
./leafgen/leafmold/Depend
./leafgen/leafmold/tmp.list.marathon
./leafgen/leafmold/tmp.list.merope
./leafgen/leafmold/tmp.list.psyche
./leafgen/leafmold/tmp.list.thalia
./leafgen/leafmold/tmp.list.hepatu
./leafgen/leafmold/tmp.make.out.thalia
./leafgen/leafmold/tmp.make.out.hepatu
./leafgen/leafmold/tmp.make.out.marathon
./leafgen/leafmold/tmp.make.out.merope
./leafgen/leafmold/tmp.make.out.psyche
./leafgen/leafmold/xbmux2dh2s.tmp.eclstats
./verilog/libsrc/BOM
./verilog/libsrc/depend
./verilog/libsrc/CVS/Entries
./verilog/libsrc/tlbmp13.V
./verilog/libsrc/cplmacro1.V
./verilog/libsrc/pl_euh_macro.V
./verilog/libsrc/pl_eus_macro.V
```

```
./verilog/libsrc/Makefile
./verilog/libsrc/sc2p3a.V
./verilog/clib/sc2p3a.v
./verilog/dclib/sc2p3a.v
./verilog/zclib/sc2p3a.v
./verilog/eclib/cplmacro1.edif
./verilog/eclib/tlbmp13.edif
./verilog/eclib/pl_eus_macro.edif
./verilog/eclib/pl_euh_macro.edif
./verilog/eclib/sc2p3a.edif
./verilog/zblibsrc/logicsim.old
./BOM
./BOM.BAK
./CVS/Entries
./makerrs
./Makefile
```

So it looks as if you did the getbom as yourself as well as the make.
I suggest you remove at least the derived files in this list, and then
restart the make. It might be adequate to make these files
group-writable, but I'm not sure...

I didn't do a getbom, you did! At least I haven't done one recently.
I'll see if I can clean up my mess.

Oh. Oh? I'm confused again...

```
-clio:tom-> ll /n/auspex/s41/euterpe-snapshot/euterpe/proteus/BOM
l -rwxrwxr-x 1 tbr cad 881 Nov 5 11:07 /n/auspex/s41/euterpe-snapshot/euterpe/proteus/BOM*
-clio:tom->
```

Ah, I understand this one. I had to update the top level Makefile. It had not been released so I did a releasebom of just that file from the snapshot. That would have touched the BOM at the top.

I'll probably also own up to updating the BOM in libsrc, but that was a while back.

Subject: Re: proteus/baseplate

Hi all,

Custom_vdd_pad and custom_vdde_pad.ly cells contain the same information and map to the same cells on the space transformer.

During the time calliope was being assembled, Geert agreed that we should only have one vdde pad, and we should call it vdde. All custom_vdd_pad instances were changed into custom_vdde_pad instances. When I grep /u/chip/calliope/compass/baseplate/*.ly, I do not see any references to custom_vdd_pad. I also put a note in the Makefile saying that the custom_vdd_pad instance will no longer be supported (OLD). A while ago I removed the lines from the Makefile that map this instance.

We wanted to only have custom_vss_pad, custom_vdde_pad, custom_vdda_pad, sofa_vdd_pad and sofa_vss_pad cells.

So, given the current situation, we could either:

1. Change all custom_vdd_pad to custom_vdde_pad as previously agreed, OR 2. Change the proteus/baseplate/Makefile.base back to support both vdd pads.

Which do we want to do? Either change should be easy, but the second would perpetuate the confusion over the two different named, but identical vdd pad cells.

To implement solution 1 requires:

```
foreach f (euterpe/compass/layouts)
sed 's/custom_vdd_pad/custom_vdde_pad/g' < $f > $f.tmp
mv $f.tmp $f
end
cvs ci -m "Changed custom_vdd_pad to custom_vdde_pad"
```

To implement solution 2 requires:

```
cvs diff -r #.## -r #.## Makefile.base
vi Makefile.base      # to put back the changes
```

Fred.

|gmake: *** [dcells] Error 1

|What's going on here?

When layout dependencies are being built and some subcell can't be found, the text `_MISSING_LAYOUT_FILE_ missing-cell.ly' is put in the dependency file, to make sure that gmake knows it can't build the thing that depends on this. In this case, the missing cells are

```
-clio:proteus-> grep MISSING dcell/Depend
MISSING_LAYOUT_FILE_ XBLDH4S.ly \
MISSING_LAYOUT_FILE_ XBORL2DH4S.ly \
MISSING_LAYOUT_FILE_ XBORL2DF4S.ly \
MISSING_LAYOUT_FILE_ XBORL3DF4S.ly \
MISSING_LAYOUT_FILE_ XBLDF4S.ly \
-clio:proteus->
```

In this case, all these are used by vdactop, so we can ignore that problem. However, some other cells may not have made, since gmake ditched out when it encountered the first problem. You can get past this by manually running gmake with the -k option to cause it to build everything it can.

I want to be able to run the Makefile from the top without error, so I don't want to do it that way. I notice that in custom-list there are lots of lines commented out corresponding to other calliope stuff. Looks to me like I could just comment it out there and it will treat that one as a dcell rather than a real one.

This won't do . The cell could be burried in the custom block layout .
A simple grep in compass/baseplate won't reveal anything .
A more reliable way to search is to use vlsimm to query the hierarchy .

>custom_vdd_pad. I also put a note in the Makefile saying that the

The problem is none of this get communicated to the mask designer when they're doing the layout . I would even go one step further and remove the cell from the library once we have a clean vlsimm search .

Subject: prt problems

We read in the Bandsplit daughtercard today and found that the prt you revised Friday night had the correct number of pins, but that the body had been increased to 3.4" from the correct 3.15" length, with the extra hanging out at the pin 1 end. This does not agree with the markup I gave you Friday; can you please rectify?

Separate issue: Pattie needs the new smart card prt as soon as possible Monday; please work with Vijay to obtain the necessary mechanical criteria and get to her Monday. Let me know if there are any obstacles.

Another separate issue: Tim wrote:

Patricia Mayer wrote (on Thu Nov 3):

Another part issue that Philip mentioned was a fiducial mark for Calliope and Euterpe. ??

I think this was worked out for the TAB test board and as far as I know we said long ago we would go with the same. Maybe it never made it into the prt. I assume glen has a version in PCAD somewhere.

Tim

All parts less than (I believe) .050" pitch should have fiducials built into the prt. I thought this was addressed in the design guideline. Can you please review and ensure that this is the case. Calliope and Euterpe do have them in the TAB test board; so should the main pcb. Please get them into the prt.

Thanks,

-Tom

>We are totally dependent on Make and doing something that deliberately
>defeats it is major error.

I bow to the majority. I have removed all "cp -p" statements from
makefiles & shell scripts in:

```
proteus/clockbias
proteus/gardswarts/protowart
proteus/gards/basegen
proteus/gards/Makefile.chipbase
euterpe/verilog/bsrc/Makefile.share
```

I do beg to point out, however, that the problem we ran afoul of was
not a date-based dependency error, but a permission violation that arose
because group instead of owner permissions were being used. We may run
into similar inconsistencies of implementation in other UNIX utilities if
we start relying more often on group write permissions. It may be safer
to do all of these builds as "chip".

I tend to agree. We also have the problem that not everyone has a umask of 2. In the
proteus snapshot, I had updated and built a few things as myself, but I have now backed
those out and rebuilt as chip.

The euterpe snapshot on the otherhand is mostly owned by non-chip and may be harder to
clean up.

Tim

I'll add my voice here that we should make a rule to do all our builds as chip.
It is a simple and may avoid more of these permission problems in the future.
Once the sysadmins make the proper adjustments, everyone should be able to run as "chip"
for build purposes. Tom- could we build in an "su chip" to the build process?

There is still a big problem. I now have the snapshot up to the latest BOM, so I have the latest Makefiles.

Starting friday, the make had run most of the timing numbers, but some died becuse of the problems on mercury and merope.

Then yesterday, I started it over with brian's new Makefile. It ran leafmold and built essentially all the cells. Then it went back into the timing phase and decided it had to retime everthing. According to brian, this was expected, given that leafmold had run. I actually interrupted that run after a while because at that point I wanted to pick up the latest Makefile stuff from kurt, and get a few things I had had to touch into the BOM.

Now when I restart it, it's decided to re-run leafmold on every damn cell (1548 again). What's going on? What are the dependencies involved here? Given that I did not let the timing run go to completion I can't think it's that that has caused the leafmold reset, because presumably it would only have affected a few cells.

There is a new log in

s41/euterpe-snapshot/euterpe/proteus/makerrr

and I cannot see anything unexpected prior to the leafmold run. It did however regenerate the Depend file just prior to the leafmold build.

It remade

5 -rw-rw-r-- 1 chip 5066 Nov 6 13:17 xbor13df8s.ly

bit that's the only one. All the rest it tried failed again. I was assuming that since the list files called out all 155 it was going to do them all, but it didn't. Now it's back to timing.

I believe this would invalidate the BOM entries for the cells which have
the custom_vdd_pad as instances. Tim gave a list of things which need to
be done to keep the BOM consistant.

I thought I should remind you that when we were working on euterpe a while ago alot of the power.tab.local (or genptab.pl) files had "init inst" changed to "inst" because topt at the top-level was powering up these outputs since the interconnecting modules were missing. Now you've got so much of the top level together you should make sure these drive strength settings are changed back to "init inst", if you haven't done so already ?

That says it failed on that cell. The current incarnation of leafmold runs through a set of different routing strategies, deleting the routing from each failing attempt. Thus, if all attempts failed, the final vercon run will note no routing.

The Depend file is always remade when you do a 'gmake all'. This one cell probably got made because it had failed in all previous tries due to some soft error (the most common is not getting the edif license for slnet, which I have no good way to detect).

Subject: Hardware Bring-up meeting

Hi, I would like to begin having a weekly hardware bring-up meeting for Hestia. The meeting will work in conjunction with the software bring-up meeting but focus more on the hardware side of PCA planning and requirements, bring-up status/problems, and hardware equipment and tool needs. I would like to hold this meeting during the beginning of the week, preferably Monday afternoon or Tuesday if possible, but I need to know what would be suitable for all of you. If you could provide a response with preference, or available time slot we can try and get this meeting going.

If it's not too much of a problem, I would also like to hold the meeting a different way. Where an agenda will be posted at least one working day (I count working weekends as a workday) before the scheduled meeting. If there isn't anything of high enough priority to justify a meeting, mail notes on action items or status will be posted and the meeting can be cancelled if agreed upon.

Thanks,

Wayne

Wayne,

We should maintain some differentiation from the Monday 3pm netlist meeting. This can probably be handled by the posted agendas. How about Tuesday morning, 10:30 or 11:00?

Only four cells use custom_vdd_pad: aftop, clrepeat, cr2a, cr3a.
Euterpe only makes use through: cr2a, and cr3a.

So, I'm going to change these four layout cells under proteus/layouts.
The automatic script under mdunit should do the cvs check-in.

Could someone do a release bom that really needs this? I'm not sure what else needs to be done by others.

Tim

I just spoke with tvo and fwo. The current baseplate runs (Fracture and
DRC) should be consistent and correct since they were run of the old Makefile and used the
old cell.

Fred will make these changes and check them in but not release them.

If the DRC comes back dirty and we need to make changes then we'll batch the pad changes
in with the other changes and release a new snapshot.

If the DRC comes back clean, we have the option then of doing a release to add in the
renamed pads or wait to batch again with other changes.

We're all getting cold feet here . In light of the recently discovered fact that the snapshot proteus/baseplate/Makefile.base is one rev behind and what we have in the snapshot is really consistent wrt this problem (a case of 2 wrongs makes right) , it's agreed that we'll perform the fix and check them in , but delay the decision to propagate the changes to the snapshot until we see results from the drc run .

So I think we can start fracturing the frame any time.

None of the above cells appears in the chip layout hierarchy, so the ongoing chip DRC, LVS, and fracture should be unaffected.

As soon as the current proteus build completes (est tomorrow evening) we should look at bringing over the latest BOM from the top level and re-running the Make. I assume this will not have any effect on the fram stuff.

I got the following on releasing a BOM which I don't recall seeing before.

Does it indicate some sort of error?

Note: Forced Release of BOM in euterpe/verilog/bsrc Version 172.0

I have updated the euterpe snapshot to BOM 172.0, which includes everything except the most recent change to nb.

The following placements are incomplete:

at, icc, ife, iq, uu

(uu was not complete before). nb was also updated, but per hopper's latest placement message, I expect this to converge OK. It is running now.

The only other logic change was in Cerberus.

Subject: FINAL Decision: instruction cache tag bit change

This decision is now final.

Jay

Jay Tomlinson wrote (on Thu Nov 3):

The current micro-arch doc defines the bits of the instruction cache tag as follows:

bit	meaning
7	Caching control, exception 3 if set
6	Detail access, exception 2 if set
5..2	ignored by hardware
1..0	Execution access, causes exception 1 if > privilege

level

I propose changing the location of the Execution Access field to allow the hardware to use bit 0 as a valid bit (bit 0 of the data cache tag is the defined as the dirty-bit). This change would speed up the I-cache miss processing by allowing the hardware to invalidate the tag entry without having to write the entire entry. This change will also simplify the euterpe hardware. The tag array has a write-enable for this bit.

My proposal for the new bit definitions is:

bit	meaning
7	Caching control, exception 3 if set
6	Detail access, exception 2 if set
5..4	ignored by hardware
3..2	Execution access, causes exception 1 if > privilege

1	ignored by hardware
0	valid

level

This change will become final at 11:59PM Monday, Nov 7, 1994. Objections should be sent out immediately and can be reviewed Friday/Monday.

I added this message to remind people that use the -F option that even though the output from releasebom said the BOM was unchanged at the top level, it was forced as a release.

I, of course, had a bug in that I **always** printed it. sigh.

fixed.

vant writes:

The upper drc's on euterpe came back clean. It took 40 hours instead of the normal 64 hours (on a sparc 10). Not a dramatic improvement, but still significant. The 40 hour run was with 1 dracula and 1 vlsimm thread. The dracula thread took about 19 hours and the vlsimm thread took the 40. I've now started up another test with the vlsimm thread split into two processes on trex. I'm hoping the two processes will finish in under 30 hours, but it's hard to guage at this time. once these finish, we can look at splitting the flow up into more parallel segments to try and balance out the 19 hour dracula run with multiple vlsimm runs.

The lower drc's are much more dracula limited and splitting these up into more than 2 parts is probably not as profitable.

I've also started an all layer drc run on the cache using 1 dracula license and 4 vlsimm processes.

I've got both processes on all 4 dracula machines busy with these tests and real drc's.

Confusing, but if this all works, then it means we could really split up the drc's across as many as 7 processors or more with some tuning.

I'll keep ya posted.

Thanks,
Dave

Neat. (But now I've lost my gards machine [:-(]. Perhaps it's time to look into more sparc10 hardware.)

I'm hoping the job on tomato will be done early this morning, so you can have it back tomorrow :-)

These studies will pay off in the future as it will help in optimizing the run times to keep the drc runs short. one thing i've already seen from running the cache is the upper checks take longer than the lower because of the pedestals. It might be really beneficial to split the metals checks into 3 or 4 threads instead of the current 2.

Thanks,
Dave

Neat. (But now I've lost my gards machine [:-(]. Perhaps it's time to look into more sparc10 hardware.)

Better start some serious budget planning for 95. We are already way over.

We have ordered an evaluation of a 90MHz dual sparc module (eta 4 weeks) and according to don there is expected to be an announcement from sun in the next week or so of 100MHz modules. (The ones we have now are 50MHz I think). So there is a possibility of a significant speedup at modest cost.

Tim

gmake: *** [bsim] Error 138  
tbr@gamorra ~/euterpe/verilog/bsrc 472 % cname  
da-verilog-grx
```

Which version are we getting by default? I've not seen core dumps before.

we should be back to getting the verilog1.7 version (which we've run for about a year) by default.

Dickson had several core dumps from gmake on gammora. We have traced this to panics and hard errors on Gamorra's disks. It looks like you may have been on gamorra at the time. could you re-try from another machine?

-thanks,

Okay.

I don't have any idea what the '95 budget looks like.

I think we should plan on needing more hardware, especially as we will have multiple chips in design, verification, and fracture/tapeout.

I would approach this by saying that we will be able to offset our hardware purchases by some amount as we reduce our software (CAD) costs by moving to our own home-grown tools.

Should we meet to discuss this further?

You don't seem to have understood my question. Timing code is simulating software that will be running on Euterpe in a Hestia system. Code in the .../gnu-tools/sim/terp/calliope is simulating hardware that's part of Calliope.

I think I figured out the answer to my question: you're using cable-in.c to run your simulations in addition to the hardware simulation. I see you've got a very non-standard setup for this, Makefile-wise, but I guess I see what's going on.

Subject: euterpe upper drc's finished again

the latest test of euterpe upper drc's finished. and it only took 21 hours versus 64 for a single dracula run. The two vlsimm threads were using trex and the dracula thread was on medusa. with the latest revision to the drc flow, the run time should be around 20 hours for this version of euterpe. As we add more routing metal, the runtimes will take longer, but not very much. We might optimizitically get a fullchip metals drc in 24 hours using 3 processors (2 of which are sgi).

I think I'll start up some tests on the lower layers to try and get those running a lot faster.

Dave

Subject: Software Bring-up Meeting - November 9, 1994

Software Bringup Meeting

November 9, 1994

Next Meeting: November 16 at 10:00 am.

Review of the bring-up section of the euterpe schedule.
Review of CBI related issues.

Attendees: jeffm, guarino, gmo, wayne, doi, sandeep, gregg

Review of Action Items

Item: How are we supposed to track individual components in verification?

Who: mudge

Status: complete

Johnny talked to Trancy and JT and they were planning on putting a combination wafer/lot number on each of the tab devices. It was noted that this would not uniquely identify any particular chip.

Johnny has more follow-up to do in regards to this item but it is outside the scope of this meeting.

Item: Are there plans to allow tab devices to be replaced on boards?

Who: mudge

Status: complete

Johnny has said that there has been talk of allowing tab devices to be removed from boards and another device substituted.

There is also more follow-up work on this topic but it is outside the scope of this meeting.

Item: Define Parallel interface

Who: wayne, gmo, sandeep

Status: complete

Description has been added to the CBI document.

Item: Implement parallel port device drivers for sun and sgi.

Who: sandeep, doi

Status: on hold

Sandeep discovered that the parallel port on the sgi machines is not documented (which would prevent any local development of a device driver) and also does not support and form of interrupt mechanism (which we assumed in talking about how we would implement this workstation portion of the parallel CBI interface).

There is more discussion on this item later in the minutes.

Item: Define the boot state for standalone tests
Who: gmo, jeffm
Status: done

We have now added a new action item.

Item: Write up a plan for virtual devices and their interaction with gdb.
Who: gmo
Status: in progress

Item: Build scripting/UI capabilities above gdb for regression tests.
Who: doi
Status: no progress

Item: Create a separate tool for loading flashROM
Who: wayne
Status: done

The prom programmer company has supplied the algorithm and it has been tested satisfactorily.

Item: Implement remote gdb with the software simulator
Who: sandeep
Status: in progress

Sandeep is almost done. He is able to debug the ukernel and is now working on downloading and debugging applications.

Item: Get durations for items on the schedule for hestia function test
Who: doi
Status: in progress

Some dates have been supplied but more are needed. Derek will send out mail with the missing dates identified.

Item: Add the verification group's test control document to the bring-up plan.
Who: jeffm
Status: done

Item: Identify our bring-up tools and make sure we have plans for how we will debug them.
Who: doi, et.al.
Status: in progress

Item: Develop plan for testing real-time software before the analog parts of calliope work.
Who: gregg
Status: in progress (plan by 11/16)

Item: Determine which pins can be software controlled on each of the sun port.
Who: doi
Status: in progress (done by 11/16)

Item: Ask Craig if an abort invalidates the byte in transit or the entire packet.
Who: wayne
Status: done

Item: Create performance test plan
Who: jeffm, guarino
Status: no progress

Item: Add Unix-like tests to software acceptance tests.
Who: guarino
Status: slight progress

New Action Items

Item: Write the boot code
Who: gmo
Status: new

Item: Add gdb stub to boot code
Who: sandeep
Status: start on 11/14

Item: Virtual device support
Who: gmo, sandeep
Status: start on 11/14

This will actually start after gdb boot stub has begun.
Sandeep estimated a finish time of 12/19.

Item: CerbROM support from terp.
Who: gmo, sandeep
Status: new

General Discussion

There is going to be a separate meeting to discuss the hardware portion of the bring-up process. This will be initiated by wayne and the first meeting is scheduled for monday (11/14) at 4:00pm.

Jeff mentioned that he could make use of cerbROM support in terp right away. This resulted in a new action seen above.

There was some discussion about alternatives to using the parallel port to talk to the CBI hardware in light of the news that our planned implementation for the sgi machines may not be possible.

We brain-stormed some possible configurations:

Explanation of abbreviations:

gcbi gpib interface on CBI.
ecbi ethernet interface on CBI
mcbi micro-controller imbedded in CBI to handle the
unspecified interface.

1. [workstation] <ethernet> [ethernet/gpib] <gpib> [gcbi] <cerberus> [hestia]
[translator]

pros: Any hestia box is accessible from any workstation (just like having a hestia on everyones desk without actually having a hestia on everyones desk).
Ethernet/gpib translator already exists.
Gpib and parallel definition are very similar.
cons: Expense of translator (~\$300)

2. [workstation] <gpib> [gcbi] <cerberus> [hestia]

pros: Gpib and parallel definition are very similar.
cons: Cost of gpib card for workstation.

Will driver for gpib card support the functionality that we want?

3. [workstation] <private ethernet> [ecbi] <cerberus> [hestia]

pros: ? (gmo had some, but I forgot)
cons: Need second ethernet card for workstation.
Development of a simple cerberus/ethernet translator.

4. [workstation] <unknown media> [mcbi] <cerberus> hestia

pros: support any media interface
cons: development time

There needs to more discussion on what we need to do to support the CBI interface in light of the pandora plans.

Do we need a parallel CBI interface or is the serial interface sufficient? Serial interface currently implies that the clock is controlled by the workstation only.

Is there any need for a low-cost interface for hestia (i.e. something other than pandora) outside the company?

Do we think we have different requirements now for an interface to hestia that we had previously?

I think we need to have a gathering of tbr, lisar, gmo, guarino, wayne, ... to further hash out what our requirments and direction should be on the CBI issue.

Subject: AST NDA (the saga)

Tim;
cc Grant and John;

Tim, as you know I would like to use the AST box to help us in the bring-up and testing of Hestia by providing a standalone interface that connected directly to Hermes. Currently the AST box has a 500MB internal bus but only supports a 200MB digital interface. When I spoke to the AST engineers a while back they were thinking about upgrading the interface to 500MB but not until 3rd Q of 95. I inquired about designing an interface for us that works around the 300MB range, and there response was positive, and what seemed of relative ease. Since then I have been trying to get a NDA signed, but have run into a multitude of problem with AST signing our NDA. So the question I have is, how much data constitutes signing an NDA, can we have them sign our NDA under some form of understanding on our part. I have outline two approaches as to what I view as necessary.

1) (minimum)

Data acquisition and stimulus rate of 350MHz. (requires us to design interface circuit)

2) (perfered)

Vol, Vil, Voh, Vih, Iol, Iil, Ioh, Iil, min-max clk duty cycle, clk to data set-up and hold time, Clock requirement (divide by 2 for stimulus), pin capacitance, data overshoot and undershoot max, data and clk signals differential.

As indicted before, I have always viewed the AST as a necessary bring-up tool to help exerise Calliope/Euterpe in a standalone mode for board and system level tests. We can still use the AST without the modification, but to connect to Hermes would require a level translator interface, and the PLL would have to be bypassed which defeats the purpose. Any help would be greatly appreciated.

Thanks,

Wayne

>

Subject: rexec problems?

Hi,

I believe I've stumbled across some difference between rexec and rsh and the result is that rexec dies. Here's the command line:

```
rexec hestia "(cd /n/hestia/s3/dracjobs/drc; /u/chip/tools/bin/vlsimm -I -t -n -f local_f.imm1 -p . -p ./immlayouts -  
v /n/rama/s4/vanthof/compass/mobi/euterpe/vlsi.boo -o drc=mobieclium.err1 mobieclium >& run_imm1.hestia.log1)"
```

and I get this:

```
sh: run_imm1.hestia.log1: bad number
```

When I change the rexec to rsh, it works fine. I may have a typo in the above line, but I can't seem to find it.

Any help would be greatly appreciated.

Thanks,
Dave

i can't duplicate this. i finally threw caution to the wind
and ran this same command as you, and it worked fine.

the only difference was that i ran it from dockmaster
instead of hestia.

Subject: Layout review

Now that the main board layout is close to completion, we would like all of the circuit designers to check the final captured schematics and this interim layout, in particular tracing out the sections that they own.

We're therefore circulating tomorrow (Friday) schematics and plots to the following people, and would appreciate it if you could report to Arya at or before the 3PM Monday netlist meeting of discrepancies in any of the three databases:

SECTION	DESIGNER
DRAM, Euterpe, smart card	woody, tbr
Upstream transmitter	ras
Ch3/4 transmitter	ras
QPSK RX	ras
Audio	yves
Phone	yves
Video	dane
RF receivers	arya
Power planes	noel, bill, graham
Power supplies	noel
IR	noel
VCOs, SAW osc.	rich
Mechanical compatibility	tbe

Thanks for your help - the netlist meeting is held in the boxers' conference room.

Graham.

Tim I've been updating the bring-up schedule and could really use a better guess than mine of when Calliope and Euterpe might be available. Would you care to provide a swag?

Calliope is entirely in the hands of the Gods (ie Al!). As for Euterpe, we have the baseplate fractured, and as of Wednesday we hit a roadblock in getting it to route. My best guess is we won't be ready to cut masks for at least 4 weeks. Recon 4 weeks to get the last mask back after that. If the process is fully up within the next month, we might expect them to process wafers as the masks come in. So first chips could be out a week or so after that. That would be 9 weeks from today.

tbe@MicroUnity.com wrote (on Fri Nov 11):

Pattie and I spoke earlier today about the schedule to complete the first pcb. We are concerned that the Monday deadline may not be met no matter how many hours she (or I) put in this weekend, due to the many features yet to be added.

Tim may not be aware that when we had the meeting yesterday with the EMI test lab President, the chassis to pcb grounding and individual analog circuit shield grounding was discussed extensively. There seemed not to be any clear, common understanding of the problem prior to this meeting, and we ended up picking this guy's brains to determine a strategy, driven by Wayne. (Not sure that this person is a bad person to turn to for such advice, but the advice greatly increased the scope of pcb work from what I expected [chassis ground to analog grounds at many points. Btw, I expect to hear from Richard Mueller next week on same subject--blinders on for now.]. We took the decision to interpose partial chassis ground planes beneath the shielded analog circuit elements and tie them to the shield wall traces with many vias. This with the local supply lines interspersed.

In addition, for lighting and ESD testing, we need to make certain we have adequate chassis ground pass through to avoid dumping spikes into the pcb ground plane. Other things not yet addressed as far as I know are DC bussing from the RO pins (Noel update if defined), and numerous other details. Bottom line is Pattie and I are concerned about meeting the monday deadline and want to keep you informed of the latest developments. Let's discuss.

There was a rather alarming message earlier from yves about taking the SDRAMs off the ground plane, which I assume was something also discussed at this meeting. I have a major problem with that, since it would mean the return path for the transient currents would have a huge loop back to the PSU and we would have serious ground bounce problems. I have no problem splitting the euterpe and calliope planes if we can find room to do it, but separating euterpe and the DRAMs with 1ns edge rate TTL signals between them would be a big disaster. I agree it seems we still have a way to go.

Subject: euterpe lvs finished

Hi Tom,

The euterpe lvs finished. The result are in

/u/vanthof/compass/mobi/euterpe/tapeout/euterpe.compare

There are about 300 devices unmatched. A quick glance through the file shows some problems with CELOW_0, CEHIGH_0, VRR34_0 -> VRR35_0, VRR54_0 -> VRR55_0, some pll signals, etc. There are a few gates which have a schematic signal called XIOBYTE1-X2P_1-X4P_1-X1P_1-LOGIC0_0P and the layout is tied to VDDI.

In addition to the mismatches, there are 96 extra schematic devices.

The output file is only 1.3MB. If you need any help, please let me know.

Thanks,

Dave

Yes, still the same. The change here was more to do with whether you can bypass the rotator or not (you used to be able to, now you can't). Though you can turnoff the IQ balancer.

> - does the IQ balance circuitry maintain 10-bit arithmetic throughout?
>

Not an easy question to answer since there are multiple precisions used.

The multiplier used is an 8x10 parallel unit. The input data from the DACs is 8-bit that is rotated (using a 10-bit SIN/COS value). The multiplier is truncating to a 10-bit result. The LMS coefficients are accumulated to 20-bit accuracy and the most significant 8-bits are used in the adaption algorithm. The eventual result is presented at 10-bits.

I believe ras has simulated the adaptive filter using these quantizations to check for precision effects. brian began work on verifying the verilog which would have included checking to ensure that there were no unexpected quantization problems with the real hardware but was pulled off to work on euterpe.

Lisar,
I think the problem is that you are enabling the channel in hc0. This leaves iorate0 still disabled.
Something else might also incorrect since iodinA0 goes to zero slightly after din0 starts changing, but iodinB0 (iobyte0 to iorate) is always X. I don't yet know what is causing this behavior, I need to go learn more about iorate.

OK with me for the power planes.

What about using the 2 INT layers to make special power planes for the SDRAM's?

But before going further, I think we need to re-visit the amount of noise the SDRAM will inject into the power delivered to Euterpe and Calliope using the L-shape power plane layout. I unfortunately don't have all the data for that.

Could you give me a rough estimate of the supply current characteristic for the SDRAM being accessed.

For Euterpe and Calliope, we have been using 2A current spikes at 1.2GHz, 300ps wide. Is it OK?

I will re-calculate the acceptable ripple for analog Calliope. I takes into account the noise frequency (100MHZ + odd harmonics from SDRAM), the amount of decoupling on the digital and the analog side and the series impedance of the L-shape power plane.

Subject: resistor code change from 5 to 6

I now understand that it has been decided to change the resistor code on euterpe from a value of 5 to 6. Although I haven't seen any discussion of this decision, I assume it is to help meet the speed targets. However, I should point out that the custom blocks, and particularly the cache were designed at resistor code = 5 and were not simulated at higher values. While I don't have particular concerns regarding functionality, I should point out that at least in the cache, power bus wiring was extremely tight and that the currents used for sizing the busses for IR drops and more importantly for electro-migration were based upon a resistor code of 5. Increasing the code to 6 will likely cause some power busses to exceed their EM limits by the percentage power increase (20%?).

I don't think there's any plan to change the resistor code for the caches or any other custom block. The problem is that the logic doesn't fit in the sofa, and bumping the power level up should help reduce gate size.

It is a defect of our current methodology that ged2spice has a resistor code built in, and that much of our analysis (both manual and automated) is based on a value hard-coded into a program. This really should be changed.

Subject: IMMINENT DECISION : Euterpe SOFA Power

Hi,

In order to make the euterpe logic fit on the 10x10 die, we have to increase the power of the SOFA area with 20%.
This will give all our gates a higher drive capability and therefore we can use smaller gates for the same drive.

We are currently rebuilding the library and after that, we'll run a set of experiments. If the results are good, this will become a FINAL decision. We'll know the results in about a week.

----- Start of forwarded message -----

To: euterpe
Subject: DECISION: event daemon

The following is a description of what is being implemented for the Event Daemon register.

A fixed Hermes sequence ID of 7 will be used for blocking reads. This sequence ID will not be available for normal operations, but multiple blocking reads to different devices on the same ring can be outstanding simultaneously, each with sequence ID 7, distinguished by the module address. Thus up to 7 normal operations and 4 blocking reads can be outstanding on each channel simultaneously. The collision detection which prevents multiple outstanding transactions to the same address in the same device will not apply to blocking reads. This is necessary because the conflict check is only approximate, looking at 6 low order address bits, and without this exclusion, normal operations could be held off pending a blocking read return.

Stores to the Event Daemon register go via NB, so back to back stores from different threads to event registers in multiple devices is supported. The Event Daemon register is decoded from the "slow peripheral" queue, and communicates directly with the appropriate Hermes channel. It is thus possible for an Event Daemon store to be processed ahead of a normal load or store previously issued to the same Hermes channel.

Hardware keeps track of pending blocking reads so duplicates can be suppressed. This deals with the problem of multiple blocking reads initiated by different threads after multiple interrupts to different threads have been returned together. Software therefore does not have to provide independent synchronization to ensure only one blocking read is posted. If an interrupt is permanently masked off in the Euterpe event register and there is a possibility that for some reason this interrupt causes the blocking read to return, a deadlock can be avoided by having a watchdog routine periodically issue another blocking read.

Software is still responsible for posting at least one blocking read for each interrupt received. ie there is no automatic hardware rescheduling of blocking reads. There is a possibility of duplicate events being signaled if another blocking read is issued by another thread before bits have been cleared in the peripheral device event register. This can be mitigated by always clearing the peripheral device event register before the corresponding bits in the Euterpe event register. However, because of possible delays in processing the store over the Hermes channel, there may still be a race here. If so, software will have to be able to handle it.

This implementation does not directly address the problem of a low priority interrupt return blocking a high priority interrupt up to the point where the new blocking read is issued.

Subject: file off of backup

I tried to use "ausrestore" (aka budtool) to get a file off of backup, but the retrieval didn't work. After a half hour of looking at volume labels it found the right one, then said it was retrieving, and then complained that it couldn't open /dev/tty and couldn't create a directory in /tmp. I'm not sure what would cause such problems, but it seems that ausrestore isn't going to do it for me. The file I need is:

/n/auspex/s6/lisa/src/gnu-tools/sim/terp/cerberus.c

It should have been saved by last night's incremental backup. Could you either get the file for me, or tell me how I can do it myself?

Thanks,
lisa

Subject: hestia power planes

Here is the latest proposal, pending a final OK from Tom and Philip on the pcb stack-up: we will have 2 separate power/gnd planes, one for Euterpe and the SDRAM and one for Calliope and peripherals. The calliope planes will be L-shaped and the other one will be closer to a rectangle.

There will be a small supply voltage difference between euterpe and calliope due to IR drop but the differential interface should not be affected.

In order to have these 4 planes, we will have the following PCB stack-up:

```

component ----- .5oz
      26mils dielectric
power 1 ----- 2oz
      2mils dielectric
ground 1 ----- 2oz
      6mils dielectric
ground 2 ----- 2oz
      2mils dielectric
power 2 ----- 2oz
      26mils dielectric
solder ----- .5oz

```

outside the outlined area, the 4 internal layer will be used differently to carry power (3.3, 5 and 12V), current carrying ground planes, shields and chassis ground planes.

If you have any objection, raise your voice immediately. A lot of layout will be done this week-end, so the power plane scheme should be finalized by the end of the day.

HADCO, our usual PCB source, has sent their sales/tech resources out this week. The construction is not impossible (at first glance) although it seems that it will be more expensive as we will be using more of the non-standard 2 on 2 copper laminate.

More next week. Go ahead and lay it out this weekend anyway. It is most likely a very marginal cost adder to our already expensive PCB.

Of course, we can always console ourselves that we have not (yet) added any blind or buried vias.

OK with me for the power planes.

What about using the 2 INT layers to make special power planes for
the SDRAM's?

I think the main issue is keeping the SDRAMs and Euterpe on the same plane.

But before going further, I think we need to re-visit the amount
of noise the SDRAM will inject into the power delivered to Euterpe and Calliope
using the L-shape power plane layout. I unfortunately don't have all
the data for that.

Could you give me a rough estimate of the supply current characteristic
for the SDRAM being accessed.

I cannot find waveforms in any of the databooks. But from experience
I would say you should expect a spike of 50 - 100mA of a few ns
duration during RAS precharge. I would be more worried about the I/O
drivers which are switching full 3V rail to rail with approx 1ns edge
rate into order 20pF. We can have about 50 of these switching simultaneously.

For Euterpe and Calliope, we have been using 2A current spikes at 1.2GHz, 300ps wide. Is it OK?

Bill would have to comment on the amplitude and duration. However, the current target cycle time on Euterpe is 1.08GHz (ie 10x the 54MHz reference), so its contribution will not have the same spectrum as Calliope.

SDRAM is likely to be running somewhat lower than 100MHz because the vendors have not yet been able to make parts above 83MHz.

We take the SOFA frequency 1080 and divide by an integer to get a frequency lower than but as close as possible to the maximum DRAM rate.

If you have any objection, raise your voice immediately. A lot of layout will be done this week-end, so the power plane scheme should be finalized by the end of the day.

Looks good to me.

philip@MicroUnity.com wrote (on Fri Nov 11):

What does this mean to the total power consumption (and therefore dissipation) of the euterpe chip? If most of the chip is SOFA, does this mean a 20% increase in overall chip power consumption?

It will mean approximately 20% increase in the SOFA component only. Prior to this change we had about 46W in the SOFA so it will add about 9W. There may be second order effects in our favor resulting from the shorter wires as the average gate size decreases, but that effect is likely to be < 1W.

Thanks, Tom. Now I understand the reason for the resistor code
change.

Tim & Geert, should all of the exlax arrays in Euterpe be
redesigned? Some area savings might be found in the din & dout FF
of the array, but no savings will be found in the memory cells and
word drivers.

I don't think we should redesign them. The saving would be too small to justify it.

These clockbias bugs seem to have a loooong gestation period. This one took many hours to track down and understand. The seed of this problem was planted last December 17, when a couple of lines of code were inserted to add an instance of IFL_DRV at every mast/spar junction. The lines were inserted one line too high in the source code, but this alone caused no malfunction. Many revisions of the clockbias software were made since then. The current problem was introduced in August, when an enhancement was requested to allow the gaff wiring row to be positioned either above or below the mast. Many small code modifications were required to support this change. One additional line was inserted above the out-of-sequence line lurking in the source code. This caused the out-of-sequence line to emit a whole wall of IFL_DRV straps along any spar driving atoms to its left in its last row. This was not caught in the LVS of cgclockbias, however, since those IFL_DRV straps just dangle and don't hook to anything until cgclockbias is instantiated in the main SOFA. The short then finally became apparent in the top-level LVS. It's unfortunate that we didn't catch it earlier, but I can't think of a way we could have, short of LVS'ing cgclockbias in the context of the whole baseplate.

We can either XOR the existing pattern files after the snapshot area has been updated, or we can just refracture. It's about the same amount of CPU time to do either one; I would probably opt to refracture, since if the XOR found anything wrong, we would just have to refracture again to correct the problem. (The IFL_DRV cell doesn't contain any geometry on the baseplate layers, so this change *should* only affect the metal layers.) If we want to update other cells in proteus which would change some of the baseplate layers, it's only a couple days' runtime to redo the 15 layers we've fractured so far. (Having only one primary chip to fracture instead of three helps quite a bit.)

Kurt confirmed that the domain shorts were caused by a faulty clockbias SW .
He has implemented a fix and released them .

An update to fix this problem in the snapshot should not invalidate
the lower baseplate layers but since it will probably take just as long

(compared to refracturing) to verify that this is really the case , what do you
say we just redo the whole thing so we get this change along with other proteus
changes ?

We have still not managed to get a full remake in the snapshot proteus. The timing is
running now, but I think we need to pick up the very latest top level BOM (5.570) to see
kurt's change.

We would also need to get a new BOM in the eutepre/verilog/bsrc area to pick up
the changes in the pads area .

There have been many updates to the proteus snapshot, none of which should have affected baseplate layers. I would suggest we definitely re-run and confirm that that is indeed the case after we manage to get a clean run of the top level proteus make. In the mean time, if it makes sense just to re LVS to make sure the problem really is fixed, we need to get BOM 5.570 into the snapshot. I think we can do that without clobbering the make which is currently running.

In /n/ghidra/s3/geert/euterpe/verilog/bsrc/gards

I use pim2pif & pifpack using the Makefiles in verilog/bsrc (Makefile.tst),
in I get a good geert_euterpe-iter.pim.pif.0 but the
geert_euterpe-iter.pim.pif.0.packed seems t have lost a lot of data.

HI Geert,

Hmm...
I guess the .packed output is long gone by now. Are you still having the problem? I
noticed many non-sofa cells in the .pif file. These should just be passed through
untouched by pifpack and appear in the output (I thought maybe you were losing those). I
don't see anything funny in the current .pif file in theat directory.

Tim B. Robinson writes:

How easy is it to change the code generated for the xlib entries?

I am trying to convert euterpe to run on the IKOS accelerator. Up to now we have been modeling all the flops as negative edge triggered off phi_A2P. IKOS does not have a negative edge triggered primitive flop. One way to deal with this would be to replace dffnq globally by dffq and change phi_A2P to phi_B2P in each dffq instance. This would then be a positive edge triggered flop off the opposite clock edge. I can then map that directly to either ikos or zycad primitives.

If I understand you correctly, then for example, in xbffbdf2s.v

```
// VERSION Version of Sun Sep 11 11:31:14 PDT 1994 NOISREV macromodule xbffbdf2s (  
PHI_A2P1C, PHI_B2P1C, PHI_A2P2C, PHI_B2P2C, PHI_A2P3C, PHI_B2P3C, D0_ADMPH, D0_ANDMPH,  
Q_AD0PF, Q_AND0PF);
```

```
input PHI_A2P1C, PHI_B2P1C;  
input PHI_A2P2C, PHI_B2P2C;  
input PHI_A2P3C, PHI_B2P3C;  
input D0_ADMPH;  
input D0_ANDMPH;  
output Q_AD0PF, Q_AND0PF;  
    supply1 one;  
    dffnq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_A2P1C);  
    not (Q_AND0PF, Q_AD0PF);
```

endmodule

the only line that would change is

```
    dffnq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_A2P1C);
```

to

```
    dffq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_B2P1C);
```

If this is true, then I think the change is easy. The change would only affect xlib/*.v files and those derived from them (dxlib, zxlib, exlib). Is this the desired scope or are there other representations that would need to be changed also?

It looks like we won't have power supply on this board. Am I right?

We do want it there. We have said that we will probably leave the DC/DC converter off and use a lab supply to bring up prototypes, but we need to be able to put the power supply on some boards in order to be able to measure the noise it generates in the real board/box environment. Otherwise we will not be able to measure the effectiveness of the decoupling, planes and shielding at containing the noise.

Kurt confirmed that the domain shorts were caused by a faulty clockbias SW .
He has implemented a fix and released them .

An update to fix this problem in the snapshot should not invalidate the lower baseplate layers but since it will probably take just as long (compared to refracturing) to verify that this is really the case , what do you say we just redo the whole thing so we get this change along with other proteus changes ?

We would also need to get a new BOM in the eutepre/verilog/bsrc area to pick up the changes in the pads area .

It cannot handle euterpe/verilog/bsrc/at/at.v. The problem seems to be:

```
orffl6_1/*nand*/ Upa4732Eq8000R11 ( phi_A2P, phi_B2P ,paR10_N[47] ,paR10[46] ,paR10[45] ,paR10[44]  
    ,paR10[43] ,paR10[42] ,paR10[41] ,paR10[40] ,paR10[39] ,paR10[38]  
    ,paR10[37] ,paR10[36] ,paR10[35] ,paR10[34] ,paR10[33] ,paR10[32] ,pa4732Eq8000R11_N, pa4732Eq8000R11 );
```

where it takes the module name to be

```
orffl6_1/*nand*/
```

There are other cases such as

```
dorff2_1 /*NandN*/ UfrcEnblR10 ( phi_A2P, phi_B2P ,gvaR8R9[47], gvaR8R9_N[47] ,ndxFrcR9_N[1], ndxFrcR9  
[1] ,frcEnblR10_N, frcEnblR10 );
```

where it takes the module name to be /*NandN*/

Looks like stripping comments would be a good move

There is another problem. It's failing to find some modules. I have been running it over the whole of euterpe. You can see how by looking at the end of ~tbr/euterpe/verilog/bsrc/Makefile.

It's clearly getting confused by comments, but I have been stripping them by changing the cpp command which is used to go from .V to .v

Here's the sort of output I'm getting:

ERROR: Cell iosync is not found in any library.
ERROR: Cell orff3_1/*nand*/ is not found in any library.
ERROR: Cell */ is not found in any library.
ERROR: Cell nba16x64_earrow is not found in any library.
ERROR: Cell nba16x64_earrowi is not found in any library.
ERROR: Cell nbd32x64_earrow is not found in any library.
ERROR: Cell nbd32x64_earrowi is not found in any library.
ERROR: Cell priority is not found in any library.
ERROR: Cell pqptr is not found in any library.

Tim B. Robinson writes:

How easy is it to change the code generated for the xlib entries?

I am trying to convert euterpe to run on the IKOS accelerator. Up to now we have been modeling all the flops as negative edge triggered off phi_A2P. IKOS does not have a negative edge triggered primitive flop. One way to deal with this would be to replace dffnq globally by dffq and change phi_A2P to phi_B2P in each dffq instance. This would then be a positive edge triggered flop off the opposite clock edge. I can then map that directly to either ikos or zycad primitives.

If I understand you correctly, then for example, in xbffbdf2s.v

```
// VERSION Version of Sun Sep 11 11:31:14 PDT 1994 NOISREV
macromodule xbffbdf2s ( PHI_A2P1C, PHI_B2P1C, PHI_A2P2C, PHI_B2P2C, PHI_A2P3C,
PHI_B2P3C, D0_ADMPH, D0_ANDMPH, Q_AD0PF, Q_AND0PF);
```

```
input PHI_A2P1C, PHI_B2P1C;
input PHI_A2P2C, PHI_B2P2C;
input PHI_A2P3C, PHI_B2P3C;
input D0_ADMPH;
input D0_ANDMPH;
output Q_AD0PF, Q_AND0PF;
    supply1 one;
    dffnq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_A2P1C);
    not (Q_AND0PF, Q_AD0PF);
```

endmodule

the only line that would change is

```
    dffnq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_A2P1C);
```

to

```
    dffq #1 (Q_AD0PF, one, D0_ADMPH, one, PHI_B2P1C);
```

If this is true, then I think the change is easy. The change would only affect xlib/*.v files and those derived from them (dxlib, zxlib, exlib). Is this the desired scope or are there other representations that would need to be changed also?

That's exactly the change and exactly the scope. I would want to try it out well before we unleashed anything on /u/chip though.

vltree currently makes the assumption that only module is defined per file. This way it doesn't have to open and parse every file in each possible directory but instead deduce their appropriate names by looking at the filenames. Should I open and parse all files or should we split out modules definitions into their own filename?

I have put some rudimentary comment stripping code in, but until we start using Perl version 5 (which support 'minimal' pattern matching) this is done pretty stupidly.

If we had an input line like

```
foo /* deleted stuff */ bar /* more deleted stuff */ baz
```

we would be left with

```
foo baz
```

when I was done. Comments split across lines won't be handled properly either.

If we only have one C style comment per line this shouldn't be a problem.

I don't know where the 'priority' name comes from, do you?

Let me know what you think I should do about the first problem I wrote about above.

Subject: topt reporting mux select errors

Morning,

I was running some tests this morning on the tbr_euterpe.edif in Tim's euterpe tree and found a total of 53 instances where the mux selects had no half swing drivers. I'm wondering how you would like this reported. I currently have topt report the instance name in the log file without changing the exit code status.

What I could do is report the number of failures in the log file, but report the actual instance with all the drivers of it's select lines in the stat file. Would you like the exit code to be non-zero because of these failures? I imagine not, because it would stop all progress until these were fixed.

Comments?

vltree currently makes the assumption that only module is defined per file. This way it doesn't have to open and parse every file in each possible directory but instead deduce their appropriate names by looking at the filenames. Should I open and parse all files or should we split out modules definitions into their own filename?

Splitting out the modules would be a pain, especially as some of the files are automatically generated.

I have put some rudimentary comment stripping code in, but until we start using Perl version 5 (which support 'minimal' pattern matching) this is done pretty stupidly.

If we had an input line like

```
foo /* deleted stuff */ bar /* more deleted stuff */ baz
```

we would be left with

```
foo baz
```

when I was done. Comments split across lines won't be handled properly

either.

I have changed the cpp command which we use when processing .V file to .v files to strip them. It won't take out all comments because there are lots of .v's that we get other ways and the comments are actually being put in by the tools so we can tell what went on. However, as far as I know the only ones that are causing trouble are the ones put in manually.

If we only have one C style comment per line this shouldn't be a problem.

I don't know where the 'priority' name comes from, do you?

No, and there are lots of others like 'unix.'

I will systematically remake all the .v's in this class and see how many of these go away.

Let me know what you think I should do about the first problem I wrote about above.

I think we would need to be able to handle that case and I'm surprised it has not come up before. There is a verilog parser already in perl that is used by the equation handling tools such as Veqn. Talk to hopper, there may be a short cut.

Subject: Euterpe perforation treatment

Hello, Paul -

Just so this issue doesn't fall through a crack: we need some perforation guidelines for Euterpe. As things currently stand, we have a baseplate snapshot, but nothing has yet been done to deperforate it -- it's still based on cells which contain perforations that are compliant with the last issue of the design rules.

The deperforation of Calliopel used the following scheme:

- 1) We hand-edited cells which had a relatively high rep count and removed the perforations -- approximately 130 cells.
- 2) We ran a Dracula flow to synthesize a deperforation cell which, when overlaid on the original layout, eliminated the rest of the perfs.

Questions:

- 1) Should we install the (130) deperforated baseplate cells in the proteus area, making them official for Euterpe and future baseplates?
- 2) Are infinite sheets of metal really acceptable? (If not, then we need to define new perforation parameters.)
- 3) What dimension should we use for the smallest allowable rectangular perforation? How about donut/feedthrough perfs?

Since baseplate DRC/LVS has commenced, the time is ripe to propagate those deperf edits, if we're going to do it.

- Kurt

If the current base plate has the 0.5 um square perforations we need to fill them in. I think we should replace them with larger perforations where we can, see below.

>
> 2) Are infinite sheets of metal really acceptable? (If not, then we
need

We don't know the answer to this yet but my gut feel is that infinite sheets will cause some problems. We just can't prove it yet.

>
> 3) What dimension should we use for the smallest allowable rectangular
> perforation? How about donut/feedthrough perfs?

I've discussed this with all and K.Y., it looks like 1.0 um square perforations are OK, 0.5 um square pers are not OK and we don't know about the values in between. I think that we will be going with a 1.0 um minimum dimention on perforations in the future. I'm going to have to talk with Haim about some sort of rule that forbids 0.5 um wide perforations but allows 0.5 um wide spaces between lines (probably some variation on the notch rule we came up with for poly lines.

I think we have more problems. Does the clock input in the current I/O byte have a flop the same as the data bits? If it does we are not using it in Euterpe/Calliope. If it doesn't we have a problem on Mnemo. This is because we currently rely on the dual outputs of the inbound side to determine the odd vs even bytes. Once the sampling clock is doubled up, and we only use one of the 2 paths we will use that bit of information. We need to be able to sample the clock just as a data bit in order to pass this information through.

Suppose we solve that one, possibly by adding in another flop, then Mark Warren raises another issue for testing with the PLL bypassed.

In this case we still need a sofa clock at 2x the channel clock. In an earlier discussion with Mark, we had erroneously concluded that we would handle this on the tester by providing vectors with a 2x clock, suitably skewed. This cannot work, because again we will have no way to recover the 9th bit. If we feel it is important to be able to test with the PLL bypassed, then we will need to add an additional input path to supply a 2x clock when in bypass mode. This should be straightforward because we already have the 'cli' custom block available.

Subject: Euterpe custom block interfaces

Hi,

I am a bit worried about the interfaces from the custom blocks to the sofa on Euterpe. I think the following things should be reviewed :

1. Clock connection from the sofa to the custom blocks. This is only for the register file and TLB. The layout of Euterpe should be reviewed to check the strength of this connection. We should have made strong connections, but it should be independently checked.
2. Power connections to the custom blocks. Where do the blocks get their power from : nominally and under test ? Are these connections strong enough, are there weak links ? This too should be checked on the Euterpe layout.
3. Timing : the powerlevels of the interfaces should be checked to the custom blocks ... The best way to do this is probably to independently derive from the timing tables what strength is needed and then check if the strengths we actually have are adequate.

We are working on automating all three of the above interface checks, but I am pretty sure we're not going to have this implemented before Euterpe tape-out. Can you please spend some time checking the above items and make sure we haven't made a mistake in assembly of the chip ?

If you think something else should be checked, please let us know.

Thank's

Geert

When you refer to "forbids 0.5 um wide perferations but allows 0.5 um wide spaces", are you thinking of small square holes less than 1 um on a side?

If so, then this is actually a very simple check to impliment. In fact, it's a simplification of the check for allowable pedestal sizes.

Subject: iobyte

Hi ,

On one of the Euterpe byte-channels, the input section is pretty far away from the SOFA, hidden behind the D-Cache.

Is there a problem in the timing of the signals coming out of the byte-channel into the SOFA, if these signals have a varying load-capacitance ? These signals have already been clocked by the quadrature clock and run from the byte-channel into IO .

Geert

Subject: Rebuild of sub-blocks in Euterpe snapshot

Hi,

I reran in the snapshot all the blocks that have run before. I used the new timing numbers (power * 1.2) :

AU : Timing problems (exit status 2)
CC : Placement problems
CDIO : O.K.
CJ : O.K.
CK : O.K.
CP : O.K.
CTIOD : O.K.
CTIOI : Timing problems (exit status 2)
DR : O.K.
DRIO : O.K.
ES : Timing problems (No convergence after 8 iter.)
GF : O.K.
GT : O.K.
HC : Placement problems
IO : O.K.
LT : O.K.
MC : O.K.
MST : O.K.
NB : Timing problems (exit status 2)
RG : O.K.
SR : O.K.

Geert Rosseel wrote (on Mon Nov 14):

Hi,

I am a bit worried about the interfaces from the custom blocks to the sofa on Euterpe. I think the following things should be reviewed :

1. Clock connection from the sofa to the custom blocks. This is only for the register file and TLB. The layout of Euterpe should be reviewed to check the strength of this connection. We should have made strong connections, but it should be independently checked.
2. Power connections to the custom blocks. Where do the blocks get their power from : nominally and under test ? Are these connections strong enough, are there weak links ? This too should be checked on the Euterpe layout.
3. Timing : the powerlevels of the interfaces should be checked to the custom blocks ... The best way to do this is probably to independently derive from the timing tables what strength is needed and then check if the strengths we actually have are adequate.

We are working on automating all three of the above interface checks, but I am pretty sure we're not going to have this implemented before Euterpe tape-out. Can you please spend some time checking the above items and make sure we haven't made a mistake in assembly of the chip ?

If you think something else should be checked, please let us know.

We also need to check the algorithmic side of the timing interfaces on all multi-cycle paths. Lisar has this in hand, but we may want a final review that we have all cases covered.

Hi ,

On one of the Euterpe byte-channels, the input section is pretty far away from the SOFA, hidden behind the D-Cache.

Is there a problem in the timing of the signals coming out of the byte-channel into the SOFA, if these signals have a varying load-capacitance ? These signals have already been clocked by the quadrature clock and run from the byte-channel into IO .

I would not expect a problem, because we have generous clock skew tolerance. We need a spice check on the prop delay of the worst path though to make sure the driver is high enough powered.

I just rebuild the toplevel and it's not looking as good as I had hoped. However, when I let it power-down the interfaces (based on the nof file information), I save another 10% in ato,s. I am now in the process of generating power.tab.local files for all the sub-blocks based on my top-level.

Subject: Re: i/o byte

as Tim B. Robinson was saying

..

..I think we have more problems. Does the clock input in the current ..I/O byte have a flop the same as the data bits? If it does we are not ..using it in Euterpe/Calliope. If it doesn't we have a problem on ..Mnemo. This is because we currently rely on the dual outputs of the ..inbound side to determine the odd vs even bytes. Once the sampling ..clock is doubled up, and we only use one of the 2 paths we will use ..that bit of information. We need to be able to sample the clock just ..as a data bit in order to pass this information through.

..

..Suppose we solve that one, possibly by adding in another flop, then ..Mark Warren raises another issue for testing with the PLL bypassed.

..

..In this case we still need a sofa clock at 2x the channel clock.

..In an earlier discussion with Mark, we had erroneously concluded that ..we would handle this on the tester by providing vectors with a 2x ..clock, suitably skewed. This cannot work, because again we will have ..no way to recover the 9th bit. If we feel it is important to be able ..to test with the PLL bypassed, then we will need to add an additional ..input path to supply a 2x clock when in bypass mode. This should be ..straightforward because we already have the 'cli' custom block ..available.

..

..Tim

..

..i don't see how we can debug without a bypass clock.

....

Actually it's a little more complex than that. 0.5 um wide by X um long perforations are
also a problem, we don't know what X is but it's definately larger than 3 um. We would
like to eliminate all holes in the metal that have either dimention less than 1.0 um. But
we want to allow 0.5 um spaces where the ends are not closed off (which the vast majority
should be). Cases where a metal space is formed by a fork in a metal line which later
widens are a little harder to call at this point, but we probably don't want the minimum
space to extens for longer than some fixed, but currently unknown, distance.

Paul.

Thanks. The current hole filling algorithm looks for holes which are less than 12 square microns in area, plus a few other requirements.
Converting
that flow to do a drc check is feasible once some numbers can be pinned down.

Dave

I have a spice framework that i used for calliope that can be used for this probably with some small modification. The actual circuits and identification of parasitics is, however questionable. Nobody seems to own the whole thing.

A number of people have been involved, tbr, alan, rich dickson. I am very concerned about something falling in a crack here because we don't have some sort of unified circuit description.

Subject: Euterpe PLL's

Hi,

We have change the knob-settings on all SOFA to 6, but Rich would like to keep the current PLL as is (optimized with a knobsetting of 5)

We've discussed two options :

-> rebuild the PLL with red = 6

This is quite a bit of work and Rich likes to keep the margin to go from 5 to 7.

-> build different sets of libraries at different knob-settings

We all think this is a good idea because we may need the different libraries for other purposes (like Mnemo)
However, this is going to be a lot of work and probably not finished before Euterpe tape-out.

So, the compromise is :

Build power.tab files for the PLL sofa that fix the powerlevels of all the instances in the PLL SOFA. Then, topt will not change any of the gates from the current PLL and the resulting SOFA should be the same as it is now, independently of what knob setting we use. While topt will not change anything, it will still verify that the PLL meets timing.

Actually, with the speed improving slightly, and the cell footprints either staying the same or getting smaller, there's a good chance that just re-running the Make would yield a successful build. However, keeping the 5:7 margin seems like a compelling reason to want to stay with the cell sizes tuned for rcd=5 operation.

> meets timing.

We can certainly hard-code every single component's power level, but this means that the PLL gardswarts won't be able to track any subsequent changes in the timing numbers as they are refined. Would it be more robust instead to tighten the cycle time target for these gardswarts to get back the guardband that would otherwise be lost by going from rcd=5 -> rcd=6 ? I think it would be worth a try, since it doesn't involve much effort (change one line in the Makefile and re-make). I guess the major effort would be re-doing the SPICE simulation of the final results, although we could perhaps just diff the power levels of all instances before and after, and if they didn't change (or increased) we would know that we kept our guardband.

Further comments?

Subject: Re: Euterpe PLL's

It seems that as long as the timing would be checked by topt, leaving them as they currently are would be fine. As timing files change, topt should alert us to any timing failures.

Yes, all of the exlax arrays will be re-simulated. There is an inherent race between the write wordline and the write bitlines. We always want the write wordline to switch first. I do not anticipate any problems with rcd 6.

How easily can we verify we have no race at any code setting? We certainly intend to operate at code 1 in low power standby mode.

For euterpe, I only recall 2 arrays: nba16x64 and nbd32x64. Are there any others?

I think these are the only 2.

If the current base plate has the 0.5 um square perforations we need to
fill
them in. I think we should replace them with larger perforations where
we
can, see below.
>
> 2) Are infinite sheets of metal really acceptable? (If not, then

We don't know the answer to this yet but my gut feel is that infinite
sheets
will cause some problems. We just can't prove it yet.
>
> 3) What dimension should we use for the smallest allowable
rectangular
> perforation? How about donut/feedthrough perfs?
I've discussed this with all and K.Y., it looks like 1.0 um square
perforations
are OK, 0.5 um square pers are not OK and we don't know about the
values
in
between. I think that we will be going with a 1.0 um minimum dimention
on
perforations in the future. I'm going to have to talk with Haim about
some
sort of rule that forbids 0.5 um wide perforations but allows 0.5 um
wide spaces between lines (probably some variation on the notch rule we
came
up with
for poly lines.

I agree.
Paul.

OK, we all agree that we need to do something pronto, but the precise rules are unclear at present. So, let me propose a specific plan of action that we can take to try to get much

closer to what we want than where we are, hopefully without expending lots of energy doing things that won't be necessary. Darts, overripe fruit, etc. are strongly encouraged.

- 1) Try to eliminate all holes we know of (except doughnuts around feedthroughs, which obviously can't be eliminated) in the drawn data, ignoring any concerns about over-large sheets. Assume that the rules limiting sheet size, when they are available, will allow enough wiggle room that we can add the holes automatically in the back end, without the need for manual intervention.
- 2) Add a check to the DRC flow for each metal layer (incl ContPed and vias, of course) that will flag as an error any hole that does not include at least one area of at least 1u square.
- 3) Worry about anything else later.

Geert Rosseel wrote (on Tue Nov 15):

Hi,

We have change the knob-settings on all SOFA to 6, but Rich would like to keep the current PLL as is (optimized with a knobsetting of 5)

We've discussed two options :

-> rebuild the PLL with rcd = 6

This is quite a bit of work and Rich likes to keep the margin to go from 5 to 7.

-> build different sets of libraries at different knob-settings

We all think this is a good idea because we may need the different libraries for other purposes (like Mnemo)
However, this is going to be a lot of work and probably not finished before Euterpe tape-out.

So, the compromise is :

Build power.tab files for the PLL sofa that fix the powerlevels of all the instances in the PLL SOFA. Then, topt will not change any of the gates from the current PLL and the resulting SOFA should be the same as it is now, independently of what knob setting we use. While topt will not change anything, it will still verify that the PLL meets timing.

Sounds like the right compromise, but given the new timing data assumes code 6, how will topt correctly verify timing based on that data, given we will actually be operating it with code 5?

This sounds reasonable. I would suggest that we might want to run some test cases on re-perforizing the metal with a large size hole (say 1.0 um x 1.0 um) to see if there will be any serious problems, like too much reduction in cross sectional area or problems with certain width metal lines.

Paul.

Subject: esum

I've gone around most people in my group and couldn't find any ardent lovers of esum. It replaces about 15 instructions, so if there's a need for it, it'll definitely be a win. People like it, but they're not using it and don't have specific ideas about how they would.

I'd say if it'll make tapeout happen sooner, you can get rid of it.

Subject: faking onchip start address

As more of real ifetch goes into the design, the current way of forcing execution to begin onchip, even though the pc is in rom space, will cease to work. The current way does not actually change the pc.

Already, I have been bitten three times by side-effects of this:

Any branch-and-link operation loads the real, not faked, pc into r0. I think/hope that I have made sure that no pre- or post-event pc's depend on addresses derived from a branch and link. There is also a kludge in the SW test scaffolding to work around this.

The IF exception HW currently assumes that an offchip instruction address is cacheable - and should have "reasonable" itag entries, never mind whether the gtlb indicates that the address is in a cacheable page. (I think this is a bug.) This was stopping exl0test from running, and is currently worked around.

Starting a simulation run with memory management forced on runs into the problem above immediately, preventing the _V (shortened for verilog) tests from running.

I spoke with mws today, and he indicated that there no free way to force the reset pc to be the start of ibuffer. At the cost of one more 0/1 generator, a force would be possible, by clever grouping of the 0's and 1's. Whether this would work on zycad is not clear.

Alternately, we could always pay the price of fetching the 6 * 5 instructions required to branch to the the beginning of ibuffer. This is very costly in simulation time.

Comments?

Rich replied:

@It seems that as long as the timing would be checked by topt, leaving them as @they
currently are would be fine. As timing files change, topt should alert @us to any timing
failures.
@
@rich

I think there are a couple of hazards here.

- 1) We would be freezing an optimized version of the design without any way of reproducing it from first principles -- bootstrapping and burning the bridge behind us, so to speak.
- 2) Topt won't warn us if our margin at rcd=5 starts to erode with updates to the timing libraries; we won't get a fatal error until the design fails at rcd=6.

Thst is the hole in this strategy, we have no assurance that
the PLL sofa will run at speed with resistor code 5.

In the meeting thsi morning, we were assuming that rebuilding the
PLL with different knob-settings was a big deal. However, Kurt does
not believe so. The other idea is to run with rcd=6 and use a more
agressive timing number. This too, of course does not assure that
we will meet timing with rcd = 5.

I though Rich was still looking at possibly implementing those using the lms hardware. Otherwise I guess I'll have to change terp to be bug-compatible with the hardware (Bug because if the instruction does not do what it is supposed to it just shouldn't be there, but yea I know, checking for it to produce the exceptions is more atomes, right?).

Checking to cause the exception is trivial and we will add it. We also have the gates designed for the overflow check and if our latest routing experiments with the new knob setting leave empty space we could cut them in. I doubt that will happen.

Better start some serious budget planning for 95. We are already way over.

We have ordered an evaluation of a 90MHz dual sparc module (eta 4 weeks) and according to don there is expected to be an announcement from sun in the next week or so of 100MHz modules. (The ones we have now are 50MHz I think). So there is a possibility of a significant speedup at modest cost.

Okay.

I don't have any idea what the '95 budget looks like.

I think we should plan on needing more hardware, especially as we will have multiple chips in design, verification, and fracture/tapeout.

I would approach this by saying that we will be able to offset our hardware purchases by some amount as we reduce our software (CAD) costs by moving to our own home-grown tools.

Should we meet to discuss this further?

I tlaked to steve some and he'd going to do some analysis of 1994 actual spending and relate that to headcount growth, so we can use that as a starting point for projection.

Subject: AST NDA (the saga)
Follow Up Flag: Follow up
Flag Status: Red

Wayne Freitas wrote (on Wed Nov 9):

Tim;
cc Grant and John;

Tim, as you know I would like to use the AST box to help us in the bring-up and testing of Hestia by providing a standalone interface that connected directly to Hermes. Currently the AST box has a 500MB internal bus but only supports a 200MB digital interface. When I spoke to the AST engineers a while back they were thinking about upgrading the interface to 500MB but not until 3rd Q of 95. I inquired about designing an interface for us that works around the 300MB range, and there response was positive, and what seemed of relative ease. Since then I have been trying to get a NDA signed, but have run into a multitude of problem with AST signing our NDA. So the question I have is, how much data constitutes signing an NDA, can we have them sign our NDA under some form of understanding on our part. I have outline two approaches as to what I view as necessary.

1) (minimum)
Data acquisition and stimulus rate of 350MHz. (requires us to design interface circuit)

I don't see why we would need an NDA just to request a generic interface at a specified data rate. What would be involved in the design of the interface circuits? If you have already identified components that would be compatible with our requirements perhaps it would be adequate to specify those components (or the specs of those components). That would then not involve any direct disclosure of our own interfaces

2) (perfered)
Vol, Vil, Voh, Vih, Iol, Iil, Ioh, Iil, min-max clk duty cycle, clk to data set-up and hold time, Clock requirement (divide by 2 for stimulus), pin capacitance, data overshoot and undershoot max, data and clk signals differential.

As indicted before, I have always viewed the AST as a necessary bring-up tool to help exerise Calliope/Euterpe in a standalone mode for board and system level tests. We can still use the AST without the modification, but to connect to Hermes would require a level translator interface, and the PLL would have to be bypassed which defeats the purpose. Any help would be greatly appreciated.

Thanks,

Wayne

Yeah, I believe the proper tradeoff is to try to lump all our changes into one. I don't think any of the metal changes Curtis's original message referred to have actually been made; perhaps the design changes have been made, but not a new placement and route.

Also, the report from Photronics this morning (which arrived shortly after Paul sent his message) claims they fedex'ed the contact pedestal and metall masks yesterday.

Graham and Geert,

In reading through Curtis's report on the QAM and NTSC receiver review meeting I noticed that at least three changes in the metallization layers of calliope to correct errors or improve it's performance were mentioned. Since I didn't understand all of the discussion I suspect that there were more changes than three buried in the meeting.

Since the Calliope metal reticles have not been made yet (Dupont still has not succeeded in making the contact pedestal layer), both Al and I agreed that we should make any improvements in the device we can and re-issue the tapes to the mask shops. It is a waste of the fab's time to make something we know isn't right to begin with. Note that when we are full up in production each wafer will cost us about \$2000 to make and in pilot production it will be closer to \$10000 each, plus \$8000 to \$10000 per reticle. This means that if we build 5 lots of each revision of a device to check it out (12 wafers per lot) it costs us about \$700000 per turn. Cutting out one revision of Calliope will pay for itself very easily.

Except that if our burn rate is \$80000/day and doing another tapeout now for Calliope, delays us by 10 days to having working Euterpe it will cost us more overall (see below).

I realize that there may be schedule impacts if we turn Calliope now but the cost of not turning it could be a lot higher in both schedule and \$'s. If there are any improvements we can make in Calliope we should do it now before any reticles are made.

We know of several corrections that need to be made. However, non of these are thought to be show stoppers as far as being able to demonstrate Hestia in a controlled environment. They would be show stoppers for real deployment in trials.

We have not been going through a re-tape out exercise for two reasons. First, (and graham should comment more on this), there is a very high likelihood of having to make changes in the analog areas after we characterize parts before they can be production ready anyway. So making a mask change now to correct well understood problems that we know how to work around is no help there. Second, and more importantly in my mind, doing this would delay Euterpe yet futher, and without a working euterpe so that we can run software on both chips together we will not be able to shake out system level problems that

will also likely be show stoppers if they occur. (Remember our entire verification effort to date is equivalent to a small fraction of 1 second of real time operation at 1GHz.)

So, while I agree that making fixes we already know about would be highly desirable if there were no schedule impact, I feel that in the overall plan, the critical path is getting the first limping version of Euterpe and Calliope together, and that this goal will be negatively impacted by another full blown verification and tapeout cycle on Calliope right now.

I'm not the competent party to figure out all the tradeoffs here, but I believe the strong expectation is that getting the already taped out Calliope under some probes is going to reveal other design changes that we need to make, probably in both the digital and analog areas. Also, none of the envisioned or already designed metal changes are required to check out the chips. Building things costs dollars, but so does taping them out. Given all that, it seems unlikely that doing another tapeout now will result in an overall decrease in dollars and time spent.

Yeah, I believe the proper tradeoff is to try to lump all our changes into one. I don't think any of the metal changes Curtis's original message referred to have actually been made; perhaps the design changes have been made, but not a new placement and route.

The changes have been made and the affected blocks have been re-routed. We have not rerouted the top level.

Also, the report from Photonics this morning (which arrived shortly after Paul sent his message) claims they fedex'ed the contact pedestal and metal masks yesterday.

Subject: Re: Metal changes in calliope

I believe that we should use the existing tapes that have already been released to make our first Calliope wafers.

My expectation is that while many of the analog sections will show reasonable functionality and be characterizable on first silicon, we may require as many as two full mask changes (all layers) before a full-function Hestia can be produced in moderate volumes for trial deployment.

The metal corrections so far identified pale into insignificance compared to the diffusion changes that will most likely be required after this first evaluation; and none of the metal corrections preclude making the initial diagnosis.

I therefore feel that we should focus CAD/design energies on Euterpe and Mnemo right now, and reserve these Calliope metal corrections, (along with probably a much more substantial set after first silicon evaluation) for the rev. 2 mask set.

Graham.

I agree with most of your points. In talking to ras it became clear that I hadn't

expressed one of the major worries that Al and I have. We all under-

stand that the first revision of Calliope had little chance of being usable in a final product, even before the problems we now know about were discovered, because of the fact that many of the circuits would need tweeks to be fully functional. We are concerned that if the changes that we now know are needed, that haven't been included in the current revision, also need tweeks then not putting them onto the revision now means that we will need another full design turn later to incorporate those tweeks. This would mean that not only would Calliope 1 have little chance of being commercially usable but we're also admitting that Calliope 2 will not be usable. If this is the case then were saving 10 days on the schedule now at the cost of 2 months or more later (redesign, varification, fracture, mask generation, fab and test).

This doesn't sound like a good trade-off.

Paul.

I counted only 6 output pins for SO including the I/O direction bit.
We would need another bit/pin to provide a clock that's synthesized in software. We would
also have to run the output interface at least 2x the symbol rate and every once in a
while we would add an extra cycle between clock edges to maintain synchronization with the
real symbol clock.

Fur brought up the point that we might be able to use the ttl output pins on euterpe that
are used to drive the LEDs. Apparently there are
8 of them? Is there any validity to this approach?

In response to tbr's question, a "full mux" data output is definitely outlined in the
Toltec spec as part of their HSSI interface and it sure isn't defined.

Software Bringup Meeting

November 16, 1994

Next Meeting: November 23 at 10:00 am.

Review of the bring-up section of the euterpe schedule.
Review of CBI related issues.

Attendees: jeffm, guarino, gmo, wayne, doi, sandeep, gregg

Review of Action Items

Item: Implement parallel port device drivers for sun and sgi.

Who: sandeep, doi

Status: on hold pending discussion of CBI at the Pandora Meeting (11/18)

Item: Write up a plan for virtual devices and their interaction with
gdb.

Who: gmo

Status: in progress

Item: Build scripting/UI capabilities above gdb for regression tests.

Who: doi

Status: on hold until the the boot, gdb boot stub, and virtual devices
are complete. (estimated start date of 12/23)

Item: Implement remote gdb with the software simulator with microkernel

Who: sandeep

Status: done.

Item: Get durations for items on the schedule for hestia function test

Who: doi

Status: in progress

Here are the current estimates:

Working Boot, Gdb boot stub, Virtual Devices	6 weeks
write boot code	
write gdb boot stub	
write support for virtual devices	
bring-up on terp	
Bring-up boot on hardware simulator	2 weeks
Bring-up gdb boot stub on hardware simulator	4 weeks
Bring-up workstatation <-> hestia debug env.	?? weeks
Bring-up boot and gdb boot stub on hestia	?? weeks

Item: Identify our bring-up tools and make sure we have plans for how
we will debug them.

Who: doi, et.al.

Status: in progress

Item: Develop plan for testing real-time software before the analog parts of calliope work.

Who: gregg

Status: done

Item: Determine which pins can be software controlled on each of the sun port.

Who: doi

Status: in progress (done by 11/18 [11/16])

Item: Create performance test plan

Who: jeffm, guarino

Status: no progress

Item: Add Unix-like tests to software acceptance tests.

Who: guarino

Status: no progress

Item: CerbROM support from terp.

Who: gmo, sandeep

Status: nearly done.

New Action Items

-

Item: Simulator needs to understand 'reset'

Who: gmo

Status: in progress (due 12/23)

Item: Implement and bring-up boot, gdb boot stub, and virtual device support on the software simulator.

Who: sandeep/gmo

Status: in progress (due 12/23)

General Discussion

-

None. Looking forward to the friday pandora meeting.

Follow-up Data (This occurred after the meeting but was included here)

-

After the meeting, Loretta and Guillermo got together and came up with the following:

Here are some back-of-the-envelope estimates Gmo and I came up with after today's meeting:

We'll need to download programs: the Unix kernel is ~1 megabyte, the digital TV application (with the microkernel) is about 200 kilobytes. The smallest acceptance tests are 20 kilobytes.

We'll need to support virtual devices: the load from the console should be negligible; we also need a virtual disk and virtual network. Real workstations get 3-4 megabytes per second from the disk and 1 megabyte per second from the network.

I/O buffering for realtime testing of TV application: 4 megabytes of input and 4 megabytes of output.

We'll need support not only for hardware bring-up itself, but for remote debugging to get the software working after we think the hardware is working.

Cost issues: we've discussed several scenarios for connecting to Hestia from a workstation; here are additional hardware costs associated with each:

serial port:	dedicated host to poll the port
parallel port:	interface card for host
dedicated ethernet:	interface card for host
full ethernet:	interface for CBI
gpib:	interface card for host

Guillermo adds:

I wanted to add the fact that except maybe for the real-time code testing requirements, everything else mentioned is a requirement again for Pandora bringup. That is, I do envision bringin up OSF on Pandora using the virtual devices first, and then adding the PCI drivers.

Subject: html vs Frame, screen vs paper, in doc displays

Sometime fairly soon I think we should convene a review of the types and functions of documentation we want to produce and the audiences for whom we want to produce them.

Specifically, I see a need to find the right mix of highly formatted page-oriented documents (such as FrameMaker produces) with user-formatted on-line documents and hypertext (such as those supported by html and displayed by Mosaic).

There are major differences in the way these systems view the world. Frame is oriented to giving the author very precise control of the appearance of a document (or to switch from one very precise appearance to another).

HTML gives all that control to the receiver rather than the sender of a document. HTML does not permit the author to specify a document's appearance, only its logical structure and connectivity. HTML deals with hierarchical streams of text, but has no concept of such two-dimensional things as pages or tables. (Despite Mosaic's use of the term "home page", it isn't a page in the paper sense.)

This is a major issue for us because our documentation has made heavy use of tables, but HTML has no concept of a grid of cells. (The best it can do is take a fixed-size snapshot of a table, which then remains undigested within the viewer's dynamically reformatted flow of text.)

There are many very attractive things about using Mosaic to display HTML-based documents, but it will be quite complicated to move Frame documents to that environment. So we need to decide what we are trying to achieve, and choose the tools for the aims...

If this is the case then we were saving 10 days on the schedule now at the cost of 2 months or more later (redesign, varification, fracture, mask generation, fab and test). This doesn't sound like a good trade-off.

I think there is relatively little chance of such a second order effect provided we devote a full verification effort to the revised tapeout. The errors we are discussing here are not the result of bugs undetected in verification before the first tapeout, but rather errors in our understanding of the required functionality. Ie we built what we intended, but it turned out it was not what was actually needed as our understanding of the software matured. There will continue to be exposures of this kind till we have at least a first limping chipset (ie Calliope/Euterpe pair) which will allow realistic software to run in real time.

Paul Poenisch wrote (on Wed Nov 16):

I agree with most of your points. In talking to ras it became clear that I hadn't expressed one of the major worries that Al and I have. We all under-

stand that the first revision of Calliope had little chance of being usable in a final product, even before the problems we now know about were discovered, because of the fact that many of the circuits would need tweeks to be fully functional. We are concerned that if the changes that we now know are needed, that haven't been included in the current revision, also need tweeks then not putting them onto the revision now means that we will need another full

design turn later to incorporate those tweeks. This would mean that not only would Calliope 1 have little chance of being commercially usable but we're also admitting that Calliope 2 will not be usable. If this is the case then we're saving 10 days on the schedule now at the cost of 2 months or more later (redesign, varification, fracture, mask generation, fab and test). This doesn't sound like a good trade-off.

I think there is relatively little chance of such a second order effect provided we devote a full verification effort to the revised tapeout. The errors we are discussing here are not the result of bugs undetected in verification before the first tapeout, but rather errors in our understanding of the required functionality. Ie we built what we intended, but it turned out it was not what was actually needed as our understanding of the software matured. There will continue to be exposures of this kind till we have at least a first limping chipset (ie Calliope/Euterpe pair) which will allow realistic software to run in real time.

Based on several methods of estimating the via inductance, the inductance of a 32mil long, 10 mil diameter via is between 0.22nh to 0.38nh. Based on this we would need between about 15 to 30 vias for the substrate current (assuming the via inductance is the only major inductance involved and, a required 10mV ripple allowed on substrate voltage, 200mA peak spikes, and 300ps dt.) I will be looking at this issue a little more in detail, but I think the results would indicate that about 30 or 40 vias would be more than enough.

tim,

i've got rich m's in range detector logic first cut done.
i still need to simulate it a bit more. i placed and routed it
in a tmp directory in my euterpe directory tree. i'd like to
check it in the mnemo directory tree. what are your thoughts on
where it should go ie mnemo/verilog/src/ck ???

See the last message to rich. I think it should go in
proteus/verilog/src/pl
with the rest of the PLL stuff, since these PLLs are supposed to be
generic, even though we never seem to use the same one twice!

Please have module names starting pl_ to follow th convention.

>

What is the DC current capacity of the vias? 40 would give us about 1/2A per via which feels very comfortable to me, and in fact is likely to be considerably more than we get at the PSU end where we have double the current. Has anyone calculated this?

BP,

Here is the lvs report on MB (on ISS). It seems to be complaining on the block that Orlando worked on (MBXDEC). Question: Was MBXDEC ran on Dracula or ISS? Was it ISS lvs clean? Is MBXDEC heirarchically correct? I haven't really looked over the results yet but I suspect there's probably a subcell that was flattened within another cell.

Arya's calculation relates to the vias from Calliope/Euterpe substrate (back of the die) to ground. These carry only ac current induced by the collectors and the drain of the transistors. These vias are under the spacer planes outside the tab frame area.

Regarding the vias carrying the main ground current, they connect the back of the space transformer to the board ground plane. They are immediately underneath the space transformer. I used the following calculation for the number of via:

For Euterpe, we have 25A DC current with 3A spikes, 300ps wide. In order to keep the ripple below 50mV, $L = V * dt/dI = 0.050 * 150 \text{ e-12} / 3 = 2.5\text{pH}$ With 0.25nH per via, we need 100 vias.

On the other side Euterpe has 113 VDDE pad on the TAB, therefore 113 vias to the power plane.

Therefore, I settled for 144 (12X12) minimum size vias with 42mils space.

This cover

an area of about 11.7 mm on a side, slightly more than the space transformer area.

The same number of via was used for Calliope, which has a lower current but needs a quieter supply for the analog section.

DC wise, we should not have any problem with that many vias.

Jean-Yves

Subject: event daemon

Tim,

yesterday scott came by and we discussed his proposed change to the event daemon. Mainly, he would like to use the HC queues instead of the SP queue. I think this is actually simpler and is likely to cost less euterpe atoms.

The only added complexity (given today's nb protocol) is that hc will have to manuf. a store response to nb. The sol'n to this will likely cause me to make store responses at the time the packet is sent to the channel. This may be able to reduce the size of the write response fifo. I hate to get into this when we may end up getting rid of store response to nb anyway.

The other main question that I had, is what address do we pick. Do we eat into the 32-bit hermes address? Do we use the upper channel address bits, which will only work for this implementation?

Just something to think about.

Jay

Jay Tomlinson wrote (on Thu Nov 17):

Tim,

yesterday scott came by and we discussed his proposed change to the event daemon. Mainly, he would like to use the HC queues instead of the SP queue. I think this is actually simpler and is likely to cost less euterpe atoms.

I tend to agree that we had again been overlooking the negative consequences of using the slow Q. However, it does require an architectural change to define distinct daemon addresses for each channel.

The only added complexity (given today's nb protocol) is that hc will have to manuf. a store response to nb. The sol'n to this will likely cause me to make store responses at the time the packet is sent to the channel. This may be able to reduce the size of the write response fifo. I hate to get into this when we may end up getting rid of store response to nb anyway.

The other main question that I had, is what address do we pick. Do we eat into the 32-bit hermes address? Do we use the upper channel address bits, which will only work for this implementation?

Just something to think about.

We need an address per hermes channel and we should allow for the possibility of implementations with more channels. However, we ought to keep them out of the 32 bit range. I think this will mean adding another term to the front end decoder in NB to drop them into the right Q. You will also have to mark them somehow (probably the address is enough), so that you know what they are when they get to hc.

This means using a unique space to identify this. We could use one space for all channels. Scott didn't seem to care much for this idea when I suggested it to him, but I don't think he was totally against it. He was more in favor of using the 32-bit range. I agree with you that we shouldn't prevent ourselves from having a bunch of memory out there.

As far as your orig plan of using the SP queue. Was this viewed as an architecture change (long term) or strickly a micro-architecture deviation from the arch (this implementation only)?

If you have some time today, could you talk to Craig about this, I don't want this to drag out.

Lisa,
Do you have any plans for verificiation of read/write of the CMOS arrays in euterpe? I bring this up because by inspection I noticed that the gtlb write enable is not asserted for enough cycles. I think the models need to be updated to make this detectable in some way (maybe writing x's).

We have models in place for the icache, dcache, itag and dtag which will be picked up in the next simulator build but not yet for the gtlb and register file.

Subject: Microarchitecture release 1.5

Hi,
I sent something out about this yesterday afternoon, but I don't think it ever showed up. I released version 1.5 of the microarchitecture document. The changes are listed in the change file (changes.mif). They include updates to the opcode tables, and information on valid operations in each address space, interleaved Hermes channels, exception priority, and the new format of the instruction cache tag protection field.

As always, you can print out a copy using the Makefile, type "gmake book". Or, I can print out a bound hardcopy for whoever wants one.

Any comments or suggestions welcome.
Thanks,
Bob

Subject: Re: (Fwd) Realtime Software Test Plan

A while ago Scott, you were talking about using the QPSK receiver to get bits in real-time. Shouldn't we be pursuing this option as well?
Yes, it requires a working calliope (or a barely working calliope) but the QPSK functionality in calliope is probably the lowest risk interface (since it's all digital) and it's likely to work before anything else. We can definitely use the AST box to synthesize a qpsk stream on the fly.

Verifying the output is obviously much more difficult. It sure would be nice if had a high speed generic digital interface (8 bits + clock) on euterpe that we could use to output raw data. (This came up in the context of BER testing of the QAM receiver too). I wonder if it's too late to ask for this? Here too we could use the AST box to capture the data, up to the limits of our deep memory (128 MBytes). There are too many blocks in the path between the video decoder and the NTSC output so we really do need to use memory to precisely verify full frame buffers (which should be time stamped so we can compare them to simulated output frame buffers).

We need greater than 2 Meg for the four decompression frame buffers, so it's more like 5 Meg available as buffer space.

>
> I'm certainly open to other schemes if they're feasible.
>

I'm not trying to shoot you down. I'm just reminding you of what you already know: debugging of real-time code on Euterpe is going to be difficult and probably entail a good deal of cruft. A lot of these problems could have been prevented if we had thought ahead to ensure a high-speed digital interface on Euterpe.

The shame of it is that the I/O's to handle such an interface are already on Euterpe in
the form of the LED display and keyboard interface. These lines provide a total of 12
digital outputs and 4 digital inputs, though not all of these pins are generic TTL. Early
on, I suggested that Euterpe be responsible for scanning the LED display and keyboard so
that these I/O's could be more generic. After all, the scan rate for these devices was
going to be at most a few hundred hertz, which wouldn't put any real load on Euterpe.
Unfortunately, these lines are all in the Cerberus clock domain, which renders them
difficult and slow to use.

I haven't done anything with it since we talked about it last weekend.
Is it able to let you get things done or are you stuck?

Clearly the right thing to do is to simply have smaller designs. This
way the tool wouldn't take as long to run. :-)

How about checking with Lisa about where this should fit in my priority list
so I have an idea about how much time I should spend with it?

I haven't done anything with it since we talked about it last weekend.
Is it able to let you get things done or are you stuck?

Not stuck. In fact I think I was feeding it rather more than I
needed. I think giving it the cache is what was causing it to grind
to a halt. I took that out (since it was not supposed to be in
there) and it seems to have completed in around 10 mins.

Clearly the right thing to do is to simply have smaller designs. This
way the tool wouldn't take as long to run. :-)

How about checking with Lisa about where this should fit in my priority list

I'm OK for now. The vendor of the half baked verilog translator has
promised to add library searching (eventually).

Subject: draft data sheet comments

Tony - Here are some comments on your draft data sheet. I think this is a good approach and a useful start.

Overall reactions:

1. Your data sheet is confusing because it tries to talk about everything all at once. I think it would be better to build all the data sheets, so that the later ones can refer to the earlier ones. Just as we're going to build one product on another. I've started working on a contribution -- a set of engineering driven data sheets for the Pandora-related products I think are on the table: the Pandora hardware, development software, Calliope add-in, sig gen software, sig analysis software. I'll try to have something next week sometime.

2. Your data sheet contains technical inaccuracies. The spec development process needs to be based on both two kinds of specs, driven by engineering and marketing respectively. We (engineering) need to do better in producing a concise but complete engineering spec. We've made various attempts, some of which you may not be aware of.

The main inaccuracy is due to the fact that Calliope only has one video a/d, not 3. Also, the "analog bandwidth" is somewhat different for the video/RF ins and outs -- some mix onto/off of carriers, some don't. Here are some notes towards a concise engineering spec of Calliope:

Name	Qty	Bits	SR	BW	Freq	Notes
Video in	1	8	13.5Msps	0-6MHz	baseband	
RF in	2	8	13.5Msps	0-6MHz	0-1000MHz	
Video out	3	8	13.5Msps	0-6MHz	baseband	
RF out	2	8	13.5Msps	0-6MHz	0-100MHz	
Audio in	3	16	1.69Msps	0-800KHz	baseband	16-bit to 50KHz, then less
Audio out	3	16	1.69Msps	0-800KHz	baseband	16-bit to 50KHz, then less

Notes:

The RF out DACs are actually driven at 216MHz, but I list the SR as 13.5 anyway, because that's the maximum speed software can drive it (after that, the Calliope hardware upsamples it and puts on a carrier digitally).

The RF in ADCs are actually driven at 108MHz, but the SR is 13.5 because they aren't really observable until after the digital resampler, which outputs between 8MSps and 13.5MSps.

The video DACs could all be driven at 216MHz, but there would be a problem with ring bandwidth inside Calliope. I'm not sure how hard it would be to change Calliope to be more flexible here. (It would be a

metal change, though.) I assume a similar comment applies to the video ADCs at 108MHz.

The frequency stability and accuracy of all these ins and outs will be directly related to that of the clock source driving Euterpe and Calliope.

I believe the linearity spec on the audio i/o's depends on the bandwidth of the supplied signal, and that the 16 bits applies to audio signals. I don't know the rest of the curve though. Graham knows more about this.

> `gshr0i128'
> `gushr0i128'
> `grotr0i128'
> `gmshr0i128'

All of these are just synonyms for other instructions. The way to tell which is the "real" instruction is to choose the mnemonic which is the *first* given for a new opcode/mask pair.

For example:

```
{ "g.shufflei",          0x20000000, 0xff000000, "C=a,b,h",  I_PRRH, . . .  
  "g.shufflei4mux",     0x21000000, 0xff000000, "C=A,B,h",  I_PPPH, . . .  
  "g.shufflei.4mux",    0x21000000, 0xff000000, "C=A,B,h",  I_PPPH, . . .  
  "g4mux",              0x21000000, 0xff000000, "C=A,B",    I_PPP,  . . .  
  "g.4mux",             0x21000000, 0xff000000, "C=A,B",    I_PPP,  . . .  
  "gselect8",           0x22000000, 0xff000000, "D=a,b,c",  I_PRRR, . . .
```

gshufflei4mux, g.shufflei.4mux, g4mux, and g.4mux are all the SAME instruction. The only difference between the first two and the second two is that the assembler will fill-in the appropriate values (whatever they are) for the 'h' operand if you use the short-hand "g4mux". But in the architecture, there is just one instruction (call it anything you like)

with a major opcode of 0x21. To simplify things in the simulator, we use the first string found -- "gshufflei4mux" -- for the enumeration constant, ignore any (immediately following) names with the same opcode (and mask), and then take the next opcode found ("gselect8"), and so on.

Let me know if any of that didn't make sense. (The table is definitely a delicate piece of art! ;-)

This is happening when we have two instructions with the same destination register, but with different latencies, and the two instructions finish at the same time. We anticipated this problem somewhat, but were not sure what the hardware was going to do. Does an instruction which writes a register always stall until that register is available? (I.e., an instruction has a dependency on all of its source registers *and* on its destination register(s).) If not, what does happen?

Subject: Software Bring-up Meeting Minutes - Nov 23, 1994

Software Bringup Meeting

November 23, 1994

Next Meeting: November 30 at 10:00 am.

Review of CBI related issues.
Review of the bring-up section of the euterpe schedule.

Attendees: jeffm, guarino, gmo, wayne, doi, sandeep

New Action Items

-
Item: What is dependent on SC within Euterpe? ROM & LEDs?
Reads of cerberus registers?
Who: wayne
Status: [11/23] New.

Item: Continue trying to find either source code for parallel drivers
or descriptions of hardware so we can write out own.
Who: gmo sgi machines
Who: doi sun machines
Who: wayne HPIB driver source or HW desc. for either Sun or SGI.
Status: [11/23] New.

Review of Action Items

Item: Implement parallel port device drivers for sun and sgi.
Who: sandeep, doi
Status: on hold pending discussion of CBI at the Pandora Meeting (11/18)

Jerry K. found a driver on the Linux machine that appeared
to handle interrupt based transactions.

On achilles (if you have an id on the machine) you can see
the code on /usr/src/linux/drivers/net/plipc.

Item: Write up a plan for virtual devices and their interaction with
gdb.
Who: gmo
Status: Done.

Item: Build scripting/UI capabilities above gdb for regression tests.
Who: doi
Status: on hold until the the boot, gdb boot stub, and virtual devices
are complete. (estimated start date of 12/23)

Item: Get durations for items on the schedule for hestia function test
Who: doi
Status: Done.

Item: Identify our bring-up tools and make sure we have plans for how

we will debug them.

Who: doi, et.al.

Status: Done.

Item: Determine which pins can be software controlled on each of the sun port.

The pins that are controlled are: select in, form feed, initialize

Who: doi

Status: Done.

Item: Create performance test plan

Who: jeffm, guarino

Status: no progress

Item: Add Unix-like tests to software acceptance tests.

Who: guarino

Status: no progress

Item: CerbROM support from terp.

Who: gmo, sandeep

Status: nearly done.

Item: Simulator needs to understand 'reset'

Who: gmo

Status: in progress (due 12/23)

Item: Implement and bring-up boot, gdb boot stub, and virtual device support on the software simulator.

Who: sandeep/gmo

Status: in progress (due 12/23)

General Discussion

-

Typical discussion about CBI....

Euterpe will not send a bad check byte. Since this version on Mnemosyne will not have RAM redundancy, it's not clear to me how important it would be to have a fast way to test the RAM from Euterpe. As I understand the interest here it's coming purely from a component test perspective.

To: 'euterpe'
Cc: 'jeffm'; 'bobm'
Subject: Changed to 11/6 DECISION: event daemon

Below is the mail from tbr describing the implementation of the Event Daemon register.

Recently, Scott Furman pointed out that using the NB slow peripheral queue is a problem because an Event Daemon store could be delayed waiting for a cerberus operation to complete. Thus, deadlines are missed. In order to fix this problem, there will be an Event Daemon register per channel. This allows NB to put these operations into the appropriate Hermes Channel queue.

Event Daemon stores will now be processed in order by the Hermes Channel. In order to reduce the number of bits that are required to be decoded by NB, the Event Daemon register will be put into a unique space (hw currently implemented using space==0x81 until Craig re-assigns).

Following Craig's suggestion, the Event Daemon register store data will no longer be used to identify the event register. Now only the address. The address is decoded as follows:

- 47:40 space (hw currently uses 0x81)
- 39:37 channel
- 36:35 module address
- 34:3 octlet address of event register

Other than the above changes, the description below is still accurate.

Jay

Tim B. Robinson wrote (on Sun Nov 6):

The following is a description of what is being implemented for the Event Daemon register.

A fixed Hermes sequence ID of 7 will be used for blocking reads. This sequence ID will not be available for normal operations, but multiple blocking reads to different devices on the same ring can be outstanding simultaneously, each with sequence ID 7, distinguished by the module address. Thus up to 7 normal operations and 4 blocking reads can be outstanding on each channel simultaneously. The collision detection which prevents multiple outstanding transactions to the same address in the same device will not apply to blocking reads. This is necessary because the conflict check is only approximate, looking at 6 low order address bits, and without this exclusion, normal operations could be held off pending a blocking read return.

Stores to the Event Daemon register go via NB, so back to back stores from different threads to event registers in multiple devices is supported. The Event Daemon register is decoded from the "slow peripheral" queue, and communicates directly with the appropriate Hermes channel. It is thus possible for an Event Daemon store to be processed ahead of a normal load or store previously issued to the same Hermes channel.

Hardware keeps track of pending blocking reads so duplicates can be suppressed. This deals with the problem of multiple blocking reads initiated by different threads after multiple interrupts to different threads have been returned together. Software therefore does not have to provide independent synchronization to ensure only one blocking read is posted. If an interrupt is permanently masked off in the Euterpe event register and there is a possibility that for some reason this interrupt causes the blocking read to return, a deadlock can be

avoided by having a watchdog routine periodically issue another blocking read.

Software is still responsible for posting at least one blocking read for each interrupt received. ie there is no automatic hardware rescheduling of blocking reads. There is a possibility of duplicate events being signaled if another blocking read is issued by another thread before bits have been cleared in the peripheral device event register. This can be mitigated by always clearing the peripheral device event register before the corresponding bits in the Euterpe event register. However, because of possible delays in processing the store over the Hermes channel, there may still be a race here. If so, software will have to be able to handle it.

This implementation does not directly address the problem of a low priority interrupt return blocking a high priority interrupt up to the point where the new blocking read is issued.

Geert Rosseel writes:

Hi Mark,

In the snapshot :
/n/auspex/s41/euterpe-snapshot/euterpe/verilog/bsrc/gf

there seems to be a problem with the Makefile that creates gf-base.pim

In gf.pim (the source) , there are a bunch of spacer cells to create
a 20 atom gap in the middle. However, these are not in gf-base.pim.

Geert

Hi Geert,

Technically speaking this is called a "bug". It's been fixed- what version of proteus/Makefile.rules did you use to create gf? The latest released version (released at 22:18 on 23 Nov) should fix this. I'm running gf now and it looks good so far. I noticed that the 0s cells are missing in _all_ passes except the first in the snapshot. In my area they are present in pass2 and pass3 and in this iteration of "iter" (I don't know how many gf takes).

So,
I think the bug is fixed. [You can check ~hopper/chip/euterpe/verilog/bsrc/gf
for results .]

Based on comments in the cvs log, I opened and wrote out the schematic for ioclkward to "pick-up the new pin names". My local copy of the schematic now passes the ged2verilog invocation. I have committed and released this version of ioclkward.

Please let me know if this truly fixes the problem or if it only makes matters worse.

..

.. do you mean that euterpe is incapable of sending a bad check byte?

..

..Euterpe will not send a bad check byte. Since this version on ..Mnemosyne will not have
RAM redundancy, it's not clear to me how ..important it would be to have a fast way to
test the RAM from Euterpe.

..As I understand the interest here it's coming purely from a component ..test
perspective.

..

..Tim

That's correct. We don't intend to have a test mode from euterpe. We are also looking at
BIST which could possibly be fired off from cerberus as a power on RAM test.

Implementation is still in definition phase. We envision a checkerboard/checkerboardbar
and an address uniqueness test of some kind. this would go right at the beginning of the
RAM pipeline.

Tim,

The io01ffdh6s and tlbm1col have never been run through celltest. I'll start rerunning the other cells, though I suspect we're going to get lots more celltest failures now that the rcode and voltage comparison levels have changed. The Csyn/Celltest meetings never got around to discussing the problems with the voltage comparison ranges we are currently running with.

It concerns me that tlbm1col should never have been run, since the TLB in some form has been essentially 'done' for about a year now. I thought for custom structures csyn and celltest we pre-requisites to running LVS. I realise recent changes may have invalidated those results, but clearly we need a big push here to get euterpe clean.

You have to write the event register and mask registers prior to leaving event mode.

The TLB passed celltest more than a year ago. We have been through this six months ago and this argument is back again! We used to have the automatic checkin of the ctgold directory to show that it has been done. Has that directory been destroyed?

Fred Obermeier wrote (on Sun Nov 27):

Tim,

The io01ffdh6s and tlbm1col have never been run through celltest. I'll start rerunning the other cells, though I suspect we're going to get lots more celltest failures now that the rcode and voltage comparison levels have changed. The Csyn/Celltest meetings never got around to discussing the problems with the voltage comparison ranges we are currently running with.

It concerns me that tlbm1col should never have been run, since the TLB in some form has been essentially 'done' for about a year now. I thought for custom structures csyn and celltest we pre-requisites to running LVS. I realise recent changes may have invalidated those results, but clearly we need a big push here to get euterpe clean.

Tim

Actually, there is another possibility for the current lack of these celltest results. Previous results are usually wiped away manually before running the final top-level celltest run. Also, previous results are invalidated by any change to the csyn.rules, csyn.signame, or celltest*stim voltage files. Since I've been making lots of changes to these files over the last few months, previous celltest runs should be rerun anyway.

Fred.

@

@ Hi Warren,

@

@ Everything is going pretty weel here. I am still working on the @ top-level of Euterpe. It'll be a little while before we're done.

@

@ I am definitely noticing that there is one less engineer in the group.

hmmm... that could be good or bad. It's good (for you) if you've noticed you have less troubles and re-work. But, I'll take that in the positive sense. - Thanks!

@ I am looking forward to you back here. However, enjoy your time @ with the baby. You'll be very happy later you've taken the time off.

@

@ We do have a working BJT, NMOS & PMOS. They are not perfect yet but @ the Gummel & I/V curves look pretty good. Al is going to start optimizing @ the devices now. Metal is also looking pretty good.

If there is anyone who can tune the process, it has to be Al.
This is encouraging news.

Did anyone save me a glass of champagne?

@

@ Have a Happy Thanksgiving !!!

Thanks, it was quite a meaningful day for me. It was my first one with my very own family!

Yup, that's one of the nasties. It's one that seems to work OK with the formula I haven't yet checked in, but sadly there are others that still fail.

Subject: CSM model update

Design Folks,

CSM has provided updated models for their foundry process. There are two significant changes (well, really there's only one):

1. Delta-W is reduced for PMOS. This affects narrow width PMOS devices.
2. Models will allow simulations down to $L=0.45\mu\text{m}$, $W=1\mu\text{m}$. However, minimum physical dimensions should still be $L=0.6\mu\text{m}$, $W=1.2\mu\text{m}$. The sub-minimum models are in place to aid in model smoothing. This shouldn't affect anything.

As always, comments/suggestions are welcome.

Subject: Euterpe placements

Hi,

These are the things we want to get done before rerunning the top-level placement of Euterpe (planned for Wednesday).

gf : create 20 atom gap and make two 64 bit sections.
Rich

rg : insert extra row in control section of block next to cr
shift control of bypass section into gf
Geert

mc : create straight right edge in control section
Hopper

xlu : check in and release latest placement
Tom

nb : release in /u/chip and rebuild in snapshot
Rebuild in snapshot is currently happening

mst: limit right edge to less than 548.
Rich

cdio : distribute VREF generators on a byte-wide pitch
Woody

lt : move section next to ctiod up such that it aligns with ctiod
Woody

iq, cp, cj, ctioi : placements of all 4 blocks
Brianl

.

Subject: Re: 1548 / 1548

Fred Obermeier writes:

The .checkoutrc does not run celltest since this is a very long running job. The proteus/leafgen/Makefile does have a do-celltest target that reruns all of the xb* leaf cells if they are out of date. Currently this target is only set up for the nominal condition. I'll need to change this for rcd1, rcd5, rcd6, and rcd7. This increases celltest's disk space needs for /u/chip/proteus/ctgold.nom by a factor of 4.

I don't think we have enough disk space for this yet.

The Makefile will rerun celltest if any of the source files change. Therefore, celltest will be rerun on all 1548 cells. However, if the ged2lvs results (minus comments) are the same as previous runs, celltest will skip the cell and say that this cell has passed before.

Fred.

Okay. If we have disk space problems let's definitely make sure we have all circuits covered for rcd6. Then rcd7, then 5, then 1. Disk space should not hold up these runs.

Do you have an uptodate netlist of Euterpe for celltesting?

What is the status there?

thanks,
-hopper

Cc: 'billz (Bill Zuravleff)'
Subject: Makefile woes

Y'all,

Help, I can't seem to size small pieces of my designs.

This used to work! If I want to size via topt a portion of my design -- say just a pla -- using the /u/chip/proteus/Makefile.defs and .rules, I could say "gmake file.size" or more recently "gmake gards/file-pass1.size".

Then, the following chain of rules are executed:

```
.v (v2e) -> .v2e
.v2e (emerge) -> .edif
.edif (topt) -> .stat
.stat (atoms) -> .size
```

Right?

But this breaks almost immediately. The .v2e target rule is now in /u/chip/euterpe/verilog/bsrc/Makefile.share as:

```
$(GARDS_DIR)/%.v2e: $(GARDS_DIR)/%.v2e.config vfiles
#
# Take a snooze to make sure vfiles looks older than the .v2e file
# when they are on different NFS file systems
#
sleep 10
$(V2E) -f vfiles -o $@ -c $(GARDS_DIR)/$*.v2e.config -l $(GARDS_DIR)/$*.v2e.
log $(LIB_DIRS) $(V2E_LIBS)
```

But this uses "vfiles" as its argument and so v2e's my entire design, not just the file of interest.

I don't see a .v2e target in the /u/chip/proteus/Makefile.rules.
(Possibly it got moved to Makefile.share?)

Suggestions?

Thanks,
billz

We have written software to do ch. 3/4 out. The current software is probably too simple, because it lacks filtering between video and audio, but even so it uses more cycles (over 8% of Euterpe) than are available when we're doing mpeg. There should be plenty of cycles available with analog video, so we can test it that way to verify and demonstrate functionality, but for a spin that goes into trials or something like that, we should definitely plan to add a can to the pcb.

too many pages going out.

when i wrote it i didn't think it'd be used as much as is is, so
i didn't write a fancy page queuing system.

looks like i'll need to do so soon.
in the mean time i can up the waiting period, that'll keep
each paging process trying longer.

We are going to obtain some samples of modulators, and investigate this further. It is expected that several existing components will be ultimately dropped for volume production, allowing some space to be saved within the existing outline.

Certainly this question does not affect our immediate plan to release the existing PCboard.
Graham.

Subject: 3/4 BTSC converter

Tim B. Robinson wrote (on Tue Nov 29):

...
Unless it is out long term plan to always use a can, I would advocate figuring out how to use an external converter of the type used with some cam-corders (craig has an example). Otherwise we may find ourselves having to enlarge the box again just to handle a contingency.

Tim

I believe it is rational to plan to always use a can for two reasons:

- (1) The RF modulate function is well defined, standardized, not subject to change, commoditized, and uses readily available analog signals.
- (2) The fully burdened cost (meaning including chip, chip packaging, power supply, heat sink, etc.) of the Euterpe cycles is much greater than that of the can.

If Euterpe cycles were to become more numerous and 1/3 of their current cost, the second argument would be weakened, but the first would be as valid.

- Curtis

Sorry, but I need more information, like a pointer to the executable.
(That error is only supposed to occur when you are trying to fetch an instruction from a
physical address beyond the end of the ibuffer.
The code in the simulator looks fine, so I need something with which to debug it.)

Vikki and Tacmo,

I've finished the extraction of the vdd cif files and created the appropriate links in your compass/euterpe directories. If you 'notice' you local compass library or restart compass (on a large sparc10), you should now see these files.

Thanks,
Dave

>

I'm unclear as to the question, here. The output already runs at 216MS/s, and the carrier can be set to zero. You then get video output at baseband.

Then the next question is, why do we need 270MS/s at the input? If we interleave the I/Q streams we get the equivalent of 216 MS/ as is (if we set the carrier to zero).

Who in the software area requested this? It would be easier if I could talk directly to him/her.

> How could we best do this, assuming only metal changes on Calliope

Neither of the above requires a metal change as far as I can tell.

> If we don't require a qpsk receive function, can we use that section, perhaps
> oversampling the serial stream and avoiding the need for a PLL?
>

The qpsk receiver is a 1bit ADC sampled at 648 MS/s. I need to know more about the resolution requirement.

Is this the CCIR-601 standard?

And yes, I was thinking of analog video.

> The context is that there would be a quantity of MPEG encoded video material

>

If the data stream is indeed serial (1-bit) the QPSK receiver can oversample the carrier (270MS/s) at 648MS/s and treat the serial bit as a symbol. The DDS in the QPSK then is set to rotate at some multiple of the the 270MS/s rate and the Integrate and Dump accumulator output can be used as an Early/Late PLL lock to the signal. Unfortunately, this may place quite a strain on Euterpe during acquisition, but it should take only a little attention to keep locked.

As for the transmitter, we would probably have to build something in SOFA to generate the serial stream at 270MS/s. The only transmitter is clocked at 216MS/s.

Log Message:

I made a bad assumption in my previous modifications for enabling the caches, which was that memory-management would only be enabled when presently disabled. These changes cause subsequent (redundant) writes to the cerberus control register to be innocuous.

Subject: Re: odd terp message

> The test is/stb/stand/diag/memhi/nb_2.exe

Thanks.

I just checked-in some changes so that tomorrow's simulator should not have this problem.

FYI -- Your test initializes cerberus register #6 (the control register) twice, which should not have caused a problem with the simulator, but it did. Nevertheless, I thought you might not be aware that the two memory-management enables (second one being redundant) were happening. One should be sufficient. ;-)

Finally, if you have a test (such as this one, from what I can tell) which executes out of the buffer only, you should just initialize the cache szes to 0 when writing to the cerberuscontrol register.

Then you won't need the "--ibuffer-size 32k --dbuffer-size 32k" on every invocation of terp, and the simulator won't have to allocate and initialize a bunch of cache data structures that will never even be used.

Let me know if you have any more cache-related problems.

Geert Rosseel writes:

Hi Brian,

If you have problems placing cp because of I/O powers too large, why don't you force all I/O power levels to 2s.

After it is all placed at the top-level, I can more accurately estimate the I/O power-levels. We can then do another iteration.

Geert

OK. Good idea. I've done that and am releasing cp now. You are on the page list. It won't pass timing, but at least its placement should not conflict with the other sub-blocks. I think that it is still going to be difficult to make all these subblocks work.

I will try a gmake brianl_eutepwards and see what happens.

Subject: Pandora notes

I've incorporated revisions you gave me regarding the Nov 17 (marketing) meeting, but I still need your corrections to my fuzzy reporting of parts of the Nov 18 discussion that I wrote up as "data transfer between workstation and Hestia".

I'll leave you a printout of the current set of notes, with a PostIt yellow sticky on the part that needs your review.

I will release the notes so they appear in /u/chip/pandora/doc/notes. (I'm finally getting to understand the 'make' and 'releasebom' procedures well enough to release things smoothly.) Bob Morgan has made progress in bringing up Frameviewer under the Mosaic web browser, and I think the Pandora notes will then be visible (in Frame format, not html) from within Mosaic.

Policy question:
I added the e-mail memo that Graham addressed to the group.

I was thinking of also adding a reduced and edited summary of yesterday's flurry of discussion of digital video.

But please confirm: are these mail discussions things that you would like to have incorporated into the notes file? (It seemed to me they were a continuation of the discussion by other means and therefore should be in, but one might argue that everyone concerned already has access to the mail, so that inserting summaries is redundant.)

Subject: Pandora specification

I have put together a Frame document that is intended as a shell for a Pandora spec.

At first I expected it would be a simple matter to just pull in fragments from existing documents. But I found it harder than I had expected to find appropriate material. The existing material was mostly architectural overview that really didn't say anything much about specs. So this is a VERY rough first cut.

What I have so far is in :

~paulb/cvs/pandora/doc/spec/spec.book

It has three chapters:

- Architecture
- Hardware
- Software

The table of contents specTOC.doc ought to serve as an outline.

Some of the things in there are copied from last January's draft of the Hestia spec, and are clearly incorrect here, but may serve as reminders that something like them is needed.

In a product that gets much of its functionality from software, the "Software" section of the spec seems to me likely to be much larger than one would usually find in a more hardware-based product-- but I haven't yet found material about the software a developer would need to use the testing and analysis functions. Curtis suggests we break out two hardware and three software specs:

Hardware: Euterpe
Calliope
Software Developers,
Signal Generation,
Testing/Characterization.

Subject: Euterpe snapshot

Hi,

New list of things to do.
New top-level placement of Euterpe is
planned for Friday

As usual, if you release a BOM in /u/chip, please page me (releasebom -P geert)

iq, cp, cj, ctioi : placements of all 4 blocks
fix obstruction mask problem

Brianl

cp : Check if power levels can be reduced
Rich

xlu : restore older version with control on
both sides
Tom Vo

mst : reduce height with 5 rows
Rich

mc : shift control section by some number of
atoms to the left. Tom Vo knows how much is
allowed.
Hopper

cc : place
x0 = 1629
y0 = 404
height < 82 rows
Rich

hc : place
Jay

at : place
x0 = 480
y0 = 404
height up to dcache
width up to spar at left of GTLB
Jay

io0 : place
x0 = 160
y0 = 660
height up to dcache
Hopper

nb : move to fill gap above xlu
check for fan-out problems (< 50ps margin paths)
Geert

dr : align right edge
check for fan-out problems (< 50ps margin paths)

Billz

icc : place
 x0 = 2938
 1 spar-section wide.
 place under the iq, cj, cp, section such that
 the top of icc aligns with the bottom of the
 TBL, Icachae
 Hopper

ife : size estimate
 Rich

uu : size estimate
 Mark (S.)

lt : shift long narrow part to the right by 16 atoms.
 shorten the long row in the lower part of lt.
 Jay

hz : place
 x0 = 2938
 y0 = 527
 one spar-section wide
 Rich

.

Cc: 'hestia'
Subject: Software Bring-up Meeting - November 30, 1994

Software Bringup Meeting

November 30, 1994

Next Meeting: December 7 at 10:00 am.

Attendees: jeffm, guarino, gmo, gregg, doi, sandeep

New Action Items

Item: Define and implement a snapshot environment for the HW and SW
simulators.

Who: jeffm, gmo

Status: [11/30] new.

Jeff is going to start the process off with an e-mail message
summarizing the current thoughts on the subject.

Item: Get the cycle count for oc-mem test that ran on the hardware
simulator.

Who: doi

Status: [11/30] new.

Derek will ask lisar if the data is still around.

Review of Action Items

Item: What is dependent on SC within Euterpe? ROM & LEDs?

Reads of cerberus registers?

Who: wayne

Status: [11/23] No progress.

Item: Continue trying to find either source code for parallel drivers
or descriptions of hardware so we can write out own.

Who: gmo sgi machines

Who: doi sun machines

Who: wayne HPiB driver source or HW desc. for either Sun or SGI.

Status: [11/23] progress continues.

We are no longer a Sun Catalyst member.

Out SGI Systems Integrator is going to investigate what
it would take to become a SGI developer (like Catalyst) to
see if that would get us the support (info) we need.

Item: Implement parallel port device drivers for sun and sgi.

Who: sandeep, doi

Status: on hold pending discussion of CBI at the Pandora Meeting (11/18)

Jerry K. found a driver on the Linux machine that appeared
to handle interrupt based transactions.

On achilles (if you have an id on the machine) you can see
the code on /usr/src/linux/drivers/net/plipc.

Item: Build scripting/UI capabilities above gdb for regression tests.

Who: doi

Status: on hold until the the boot, gdb boot stub, and virtual devices
are complete. (estimated start date of 12/23)

Item: Create performance test plan

Who: jeffm, guarino

Status: [11/30] no progress

Item: Add Unix-like tests to software acceptance tests.

Who: iimura

Status: [11/30] no progress

Item: CerbROM support from terp.

Who: gmo, sandeep

Status: Done.

Item: Simulator needs to understand `reset`

Who: gmo

Status: [11/30] not started (due 12/23)

Item: Implement and bring-up boot, gdb boot stub, and virtual device
support on the software simulator.

Who: sandeep/gmo

Status: in progress (due 12/23)

General Discussion

Jeffm gave a short summary of what is left to be developed for Euterpe and his estimate of
order.

- nb anit-use
- load use stuff
- uncached execution
- sync ops

We also decided to start tracking the progress of running tests on the hardware simulator
in this meeting.

I agree with your reasons, and add further (based upon our brief conversation today) that whether or not Hestia is first deployed for analog or digital conversion, the space and provisions for a 3/4 BTSC converter in a can should be in the design, for reasons of upgradability and completeness.

Therefore I will file a tkgnat on this and look for the results of the converter can survey Graham mentioned for the next revision of the pcb. In fact, I'd like to get my 2 cents in on the physical parameters of such a can. I'm concerned about fitting it in based on particular physical constraints such as at the rear panel more than on total pcb area.
